# Chapter 1

## Introduction

PICSimLab means Programmable IC Simulator Laboratory

PICSimLab is a realtime emulator of [development boards](#) with integrated MPLABX/avr-gdb debugger. PICSimLab supports some [picsim](#) microcontrollers and some [simavr](#) microcontrollers. PICSimLab have integration with MPLABX/Arduino IDE for programming the boards microcontrollers. As the purpose of PICSimLab is to emulate real hardware it does not have any source code editing support. For code editing and debugging the same tools used for a real board should be used with PICSimLab, such as MPLABX or Arduino IDE.

PICSimLab supports several devices (spare parts) that can be connected to the boards for simulation. As for example LEDs and push buttons for simple outputs and inputs and some more complex ones like the ethernet shield w5500 for internet connection or the color graphic display ili9340 with touchscreen. The the complete list of parts can be accessed in the chapter [Spare Parts](#).

The [experimental version boards](#) supports [uCsim](#), [gpsim](#) and [qemu-stm32](#) simulators in addition to the stable ones.

# Chapter 2

## Install

### 2.1 Stable version executables download

If you are on Linux or Windows you can download the last version at:

<https://github.com/lcgamboa/picsimlab/releases>

If you are on macOS you can run PICSimLab using Wine:

1. Download and install ['xquartz'](https://www.xquartz.org)
2. Download and install [Wine](https://dl.winehq.org/wine-builds/macosx/download.html)
3. Download the executable and double-click it to run the installer

### 2.2 Unstable version executables download

The binaries of last code available on github can be downloaded at: [Sourceforge.net](https://sourceforge.net/projects/picsimlab/files/)

The unstable test version have the unreleased features of [Changelog\\_auto.md](#)

If you need a specific binary that is not available please contact me.

### 2.3 Install from source

#### 2.3.1 Linux

In Debian Linux and derivatives Linux native:

**Using a user with permission to run the sudo command:**

In first time build:

```
git clone --depth=1 https://github.com/lcgamboa/picsimlab.git
cd picsimlab
./picsimlab_build_all_and_install.sh
```

To recompile use:

```
make -j4
```

### 2.3.2 Windows

Cross-compiling for Windows (from Linux or [WSL](#) on win10)

In first time build in Debian Linux and derivatives target Windows 64 bits:

```
git clone https://github.com/lcgamboa/picsimlab.git
cd picsimlab
./picsimlab_build_w64.sh
```

To recompile use:

```
make FILE=Makefile.cross -j4
```

For target Windows 32 bits:

```
git clone https://github.com/lcgamboa/picsimlab.git
cd picsimlab
./picsimlab_build_w32.sh
```

To recompile use:

```
make FILE=Makefile.cross_32 -j4
```

### 2.3.3 macOS

Theoretically it is possible to compile PICSimLab natively on macOS. But I do not have access to any computer with macOS to try to compile and until today nobody has communicated that they managed to do it. (help wanted)

### 2.3.4 Experimental version

Experimental version can be built using the parameter "exp" on scripts:

```
./picsimlab_build_all_and_install.sh exp
./picsimlab_build_w64.sh exp
./picsimlab_build_w32.sh exp
```

And recompiled using the parameter "exp" on Makefiles:

```
make -j4 exp
make FILE=Makefile.cross -j4 exp
make FILE=Makefile.cross_32 -j4 exp
```

# Chapter 3

## Simulator Interface

### 3.1 Main Window

The main window consists of a menu, a status bar, a frequency selection combobox, an on/off button to trigger debugging, some board-specific controls and the part of the board interface itself.

In the title of the window is shown the name of the simulator PICSimLab, followed by the board and the microcontroller in use.

The frequency selection combobox directly changes the working speed of the mi-

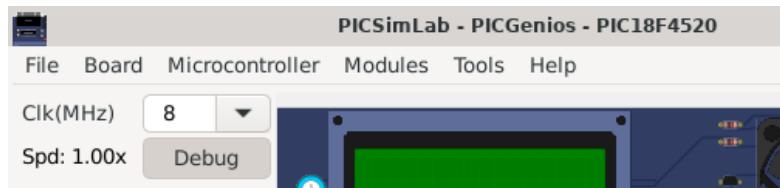

crocontroller. The “Spd” label show the ratio between simulation speed and real time. when the “Spd” label goes red indicates that the computer is not being able to run the program in real time for the selected clock. In this case the simulation may present some difference than expected and the CPU load will be increased.

The on/off button to enable debugging is used to enable debugging support, when active simulation load is increased.

The menus and their functions are listed below:

- File
  - Load Hex - Load .hex files
  - Reload Last - Reload the last used .hex file
  - Save Hex - Save memory in a .hex file
  - Configure - Open the configuration windows
  - Save Workspace - Saves all current workspace settings to a .pzw file
  - Load Workspace - Loads saved settings from a .pzw file
  - Exit
- Board
  - Arduino Uno - Choose board Arduino Uno
  - Breadboard - Choose board Breadboard
  - Franzininho - Choose board Franzininho
  - K16F - Choose board K16F
  - McLab1 - Choose board McLab1
  - McLab2 - Choose board McLab2
  - PICGenios - Choose board PICGenios
  - PQDB - Choose board PQDB
- Microcontroller
  - xxxx - Selects the microcontroller to be used (depends on the selected board)
- Modules
  - Oscilloscope - Open the oscilloscope window
  - Spare parts - Open the spare parts window
- Tools
  - Serial Terminal - Open the serial terminal **CuteCom**
  - Serial Remote Tank - Open the **remote tank simulator**
  - Esp8266 Modem Simulator - Open the **Esp8266 Modem Simulator**

- Arduino Bootloader - Load microcontroller with [Arduino serial bootloader](#)
- MPLABX Debugger Plugin - Open the web page to download the [MPLABX Debugger Plugin](#)
- Pin Viewer - Open the [Pin Viewer](#)
- Help
  - Contents - Open the Help window
  - Board - Open the Board Help window
  - Examples - Load the examples
  - About Board - Show message about author and version of board
  - About PICSimLab - Show message about author and version of PICSimLab

The first part of the status bar shows the state of the simulation, in the middle part the status of the debug support and in the last part the name of the serial port used, its default speed and the error in relation to the real speed configured in the microcontroller.

Running...      Debug: Off      Serial Port: /dev/tnt2:4800( 0.2%)

## 3.2 Interaction with the Board

On the interface area of the board it is possible to interact in some ways:

- Click in ICSP connector to load an .hex file.
- Click in PWR button to ON/OFF the emulator..
- The buttons can be activated through mouse or keys 1, 2, 3 e 4.
- Click and drag in potentiometers to change their values.
- Click on EEPROM memory to view its contents.

### 3.3 Command Line

PICSimLab supports two command lines format:

One for load a PICSimLab Workspace file (.pzw)

```
picsimlab file.pzw
```

And other for load .hex files

```
picsimlab boardname microcontroller [file.hex] [file.pcf]
```

### 3.4 Remote Control Interface

The remote control interface allows other programs to control the PICSimLab simulation through a TCP/IP socket using text formatted commands.

The PICSimLab remote control interface supports TCP connections using telnet or nc (netcat).

The default port is 5000 and can be changed in configuration windows.

The 'rlwrap' command can be used for best command edition support in telnet or nc:

```
rlwrap nc 127.0.0.1 5000
```

The supported commands can be shown using the "help" command:

```
help
List of supported commands:
dumpe [a] [s]- dump internal EEPROM memory
dumpf [a] [s]- dump Flash memory
dumpr [a] [s]- dump RAM memory
exit          - shutdown PICSimLab
get ob        - get object value
help          - show this message
info          - show actual setup info and objects
loadhex file - load hex file (use full path)
pins          - show pins directions and values
pinsl         - show pins formated info
quit          - exit remote control interface
reset         - reset the board
set ob vl    - set object with value
sync          - wait to syncronize with timer event
version       - show PICSimLab version
Ok
```

The "info" command show all available "objects" and values:

```

info
Board:      Arduino Uno
Processor:  atmega328p
Frequency:  16000000 Hz
Use Spare:  1
    board.out[00] LD_L= 254
    part[00]: LEDs
        part[00].out[08] LD_1= 254
        part[00].out[09] LD_2= 30
        part[00].out[10] LD_3= 254
        part[00].out[11] LD_4= 254
        part[00].out[12] LD_5 254
        part[00].out[13] LD_6= 254
        part[00].out[14] LD_7= 254
    part[01]: Buzzer
        part[01].out[02] LD_1= 140
    part[02]: Push buttons
        part[02].in[00] PB_1= 1
        part[02].in[01] PB_2= 0
        part[02].in[02] PB_3= 1
        part[02].in[03] PB_4= 1
        part[02].in[04] PB_5= 1
        part[02].in[05] PB_6= 1
        part[02].in[06] PB_7= 1
        part[02].in[07] PB_8= 1
Ok

```

The “pins” command show all pins directions and digital values:

```

pins
pin[01] ( PC6/RST) < 0          pin[15] ( PB1/~9) > 0
pin[02] (   PD0/0) < 1          pin[16] ( PB2/~10) > 0
pin[03] (   PD1/1) < 1          pin[17] ( PB3/~11) > 0
pin[04] (   PD2/2) < 1          pin[18] ( PB4/12) < 0
pin[05] ( PD3/~3) > 0          pin[19] ( PB5/13) > 0
pin[06] (   PD4/4) < 1          pin[20] (      +5V) < 1
pin[07] (      +5V) < 1          pin[21] (     AREF) < 0
pin[08] (      GND) < 0          pin[22] (      GND) < 0
pin[09] (   PB6/X1) < 0          pin[23] (   PC0/A0) < 0
pin[10] (   PB7/X2) < 0          pin[24] (   PC1/A1) < 0
pin[11] ( PD5/~5) < 1          pin[25] (   PC2/A2) < 0
pin[12] ( PD6/~6) < 1          pin[26] (   PC3/A3) < 0
pin[13] (   PD7/7) < 1          pin[27] (   PC4/A4) > 0
pin[14] (   PB0/8) > 0          pin[28] (   PC5/A5) > 0
Ok

```

The “pinsl” command show all pins info in text formatted output:

```

pinsl
28 pins [atmega328p]:
pin[01] D I 0 000 0.000 "PC6/RST "
pin[02] D I 1 200 0.000 "PD0/0 "
pin[03] D I 1 200 0.000 "PD1/1 "
pin[04] D I 1 200 0.000 "PD2/2 "
pin[05] D O 0 007 0.000 "PD3/~3 "
pin[06] D I 1 200 0.000 "PD4/4 "
pin[07] P I 1 200 0.000 "+5V "
pin[08] P I 0 000 0.000 "GND "
pin[09] D I 0 000 0.000 "PB6/X1 "
pin[10] D I 0 000 0.000 "PB7/X2 "
pin[11] D I 1 200 0.000 "PD5/~5 "
pin[12] D I 1 200 0.000 "PD6/~6 "
pin[13] D I 1 200 0.000 "PD7/7 "
pin[14] D O 0 000 0.000 "PB0/8 "
pin[15] D O 0 000 0.000 "PB1/~9 "
pin[16] D O 0 000 0.000 "PB2/~10 "
pin[17] D O 0 006 0.000 "PB3/~11 "
pin[18] D I 0 000 0.000 "PB4/12 "
pin[19] D O 0 000 0.000 "PB5/13 "
pin[20] P I 1 200 0.000 "+5V "
pin[21] R I 0 000 0.000 "AREF "
pin[22] P I 0 000 0.000 "GND "
pin[23] A I 0 000 0.875 "PC0/A0 "
pin[24] A I 0 000 1.925 "PC1/A1 "
pin[25] A I 0 000 2.700 "PC2/A2 "
pin[26] A I 0 000 4.275 "PC3/A3 "
pin[27] D O 1 179 0.000 "PC4/A4 "
pin[28] D O 1 186 0.000 "PC5/A5 "
Ok

```

You can view one input/output state using the “get” command:

```

get board.out[00]
get part[02].in[01]

```

Its possible use the “get” command to view individual pins state:

```

#digital state
get pin[19]
pin[19]= 0
Ok

#digital mean value (0-200)
get pinm[19]
pin[18]= 100

```

```
Ok

#analog state
get apin[25]
apin[25]= 2.700
Ok

#all info
get pinl[13]
pin[13] D I 1 200 0.000 "PD7/7"
Ok
```

And set value of one input using the “set” command:

```
set part[02].in[01] 0
set part[02].in[01] 1
```

Or set value of one pin using the “set” command:

```
#digital
set pin[10] 2

#analog
set apin[20] 2.345
```

For windows users [putty telnet client](#) is a good option to access the remote control interface.

### 3.5 Picture Map Reference

Names used in .map files for boards and parts are standardized and used by the remote control interface.

The names must start with **I**\_ if it is an input, **O**\_ if it is an output or **B**\_ if it is bidirectional. And be followed by one of the two-letter types in the table below before the area name.

<b>Function</b>	<b>Type</b>	<b>Description</b>	<b>RControl In</b>	<b>RControl Out</b>
I	MD	Memory Dump	-	-
I	KB	Keyboard Key	0 or 1	0 or 1
I	PG	Program	-	-
I	CN	Connector	-	-
B	PO	Potentiometer	0 to 200	0 to 200
B	JP	Jumper	0 or 1	0 or 1
B	VS	Value short	-32768 to 32767	-32768 to 32767
B	PB	Push button	0 or 1	0 or 1
B	DP	Dip switch	0 or 1	0 or 1
B	SW	Switch	0 or 1	0 or 1
B	RT	Rotary encoder	0 to 200	0 to 200
B	AJ	Dip switch	-	-
O	MC	Motor Cooler	-	0 to 200
O	PN	Pin name	-	-
O	ST	Status	-	-
O	IC	IC name	-	-
O	LR	LED RGB	-	-
O	LM	LED Matrix	-	-
O	DI	Display Info	-	-
O	LD	LED	-	0 to 200
O	DS	Display	-	if alphanumeric show text
O	MT	DC motor	-	dir 0 or 1, spd. 0 to 200, pos. 0 to 200
O	DG	Degree	-	float angle
O	SS	seven segment	-	decoded number

For example area named **B\_PB\_Start**, which describes the position of a push button named "Start". The **B\_** bidirectional indicates that the mapped area serves as user action input and drawing output.

## Chapter 4

# Boards

PICSimLab currently supports five backend simulators. The stable version supports [picsim](#) and [simavr](#). The experimental version supports [uCsim](#), [gpsim](#) and [qemu-stm32](#) in addition to the stable ones.

The Figure 4.1 shows which cards are based on which backend simulator:

Figure 4.1: Boards backend simulators

The below table show the supported debug interface of each simulator:

Backend	Debug Support
picsim	MPLABX Integrated Debug (see section <a href="#">7.1</a> )
simavr	MPLABX Integrated Debug (see section <a href="#">7.1</a> ) and remote avr-gdb (see section <a href="#">7.3</a> )
qemu-stm32	remote arm-gdb (see Chapter <a href="#">7.4</a> )
uCsim	uCsim remote console (telnet) (see section <a href="#">7.5</a> )
gpsim	none yet

## 4.1 Breadboard

It is a generic board only with reset, serial and crystal circuits and support to multiple microcontrollers of [picsim](#) and [simavr](#).

[Examples](#)

## 4.2 McLab1

It emulates the Labtools development board McLab1 that uses one PIC16F84, PIC16F628 or PIC16F648 of [picsim](#).

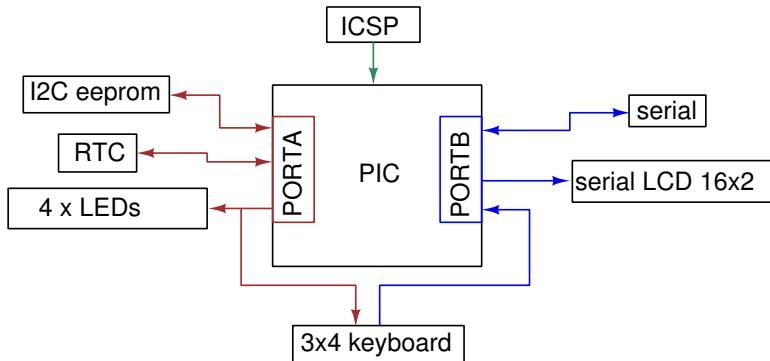

Board McLab1 schematics.

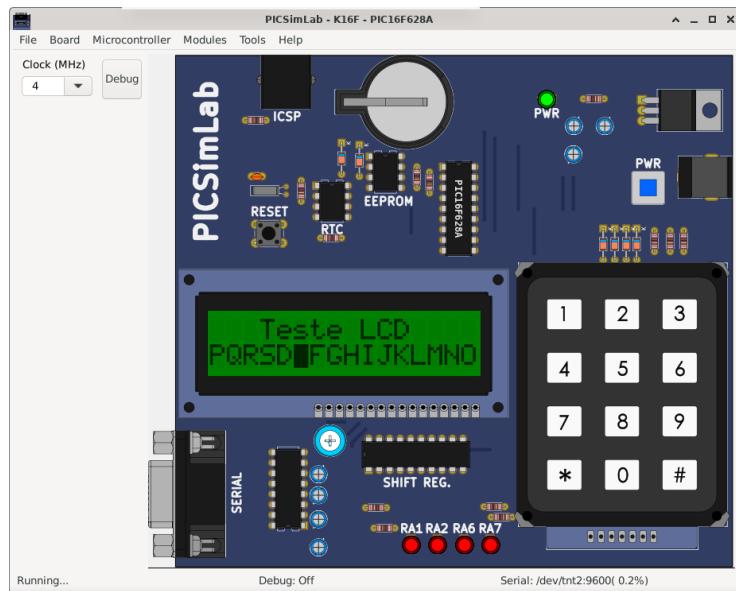

The code examples can be loaded in PICSimLab menu **Help->Examples**.

The source code of board McLab1 examples using [MPLABX](#) and [XC8](#) compiler are in the link: [board\\_McLab1](#).

### 4.3 K16F

It emulates an didactic board developed by author that uses one PIC16F84, PIC16F628 or PIC16F648 of [picsim](#).

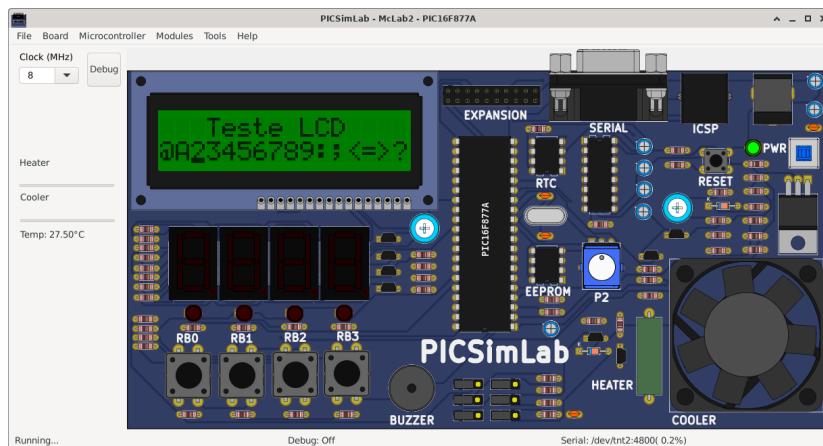

Board K16F schematics.

The code examples can be loaded in PICSimLab menu **Help->Examples**.

The source code of board K16F examples using **MPLABX** and **XC8** compiler are in the link: [board\\_K16F](#).

#### 4.4 McLab2

It emulates the Labtools development board McLab2 that uses one PIC16F777, PIC16F877A, PIC18F452, PIC18F4520, PIC18F4550 or PIC18F4620 of [picsim](#).

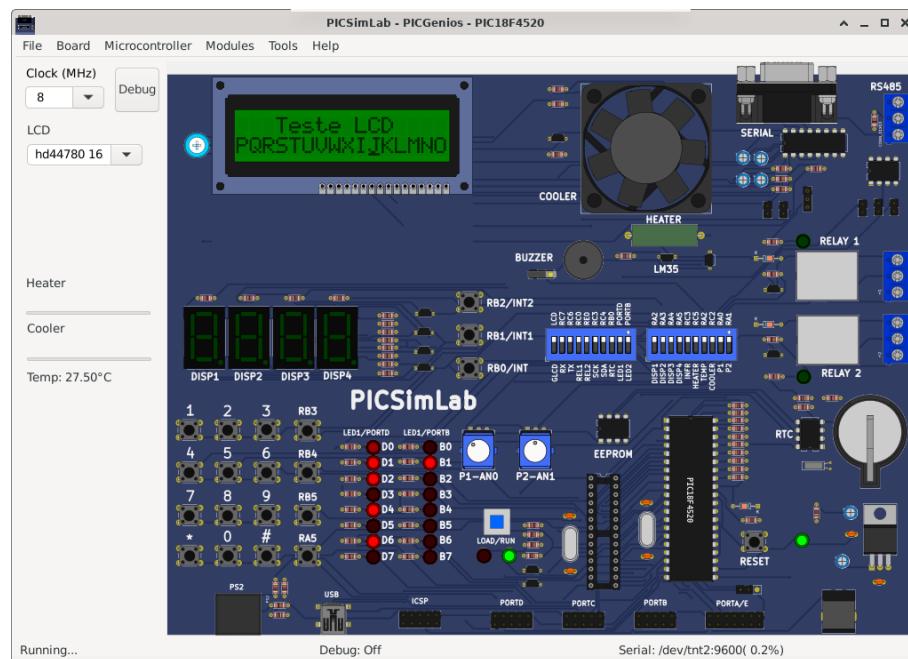

Board McLab2 schematics.

The code examples can be loaded in PICSimLab menu **Help->Examples**.

The source code of board McLab2 examples using **MPLABX** and **XC8** compiler are in the link: [board\\_McLab2](#).

## 4.5 PICGenios

It emulates the microgenius development board PICGenios PIC18F e PIC16F Microchip that uses one PIC16F777, PIC16F877A, PIC18F452, PIC18F4520, PIC18F4550 or PIC18F4620 of [picsim](#).

Board PICGenios schematics.

The code examples can be loaded in PICSimLab menu **Help->Examples**.

The source code of board PICGenios examples using **MPLABX** and **XC8** compiler are in the link: [board\\_PICGenios](#).

## 4.6 PQDB

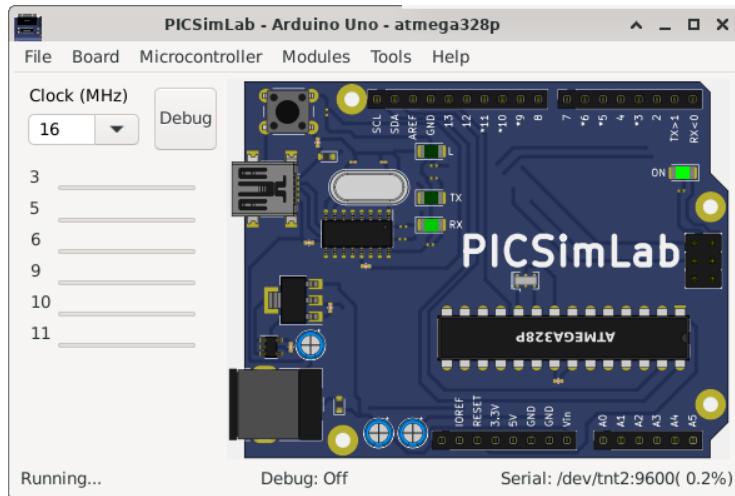

The PQDB board is an opensource/openhardware project, more info at <https://github.com/projetopqdb/>. It was developed to be used with arduino/freedom boards, but adapted to use the microcontroller PIC18F4520 of [picsim](#) on PICSImLab.

## Examples

## 4.7 Arduino Uno

It emulates the Arduino Uno development board that uses one ATMEGA328P microcontroller of [simavr](#).

#### Board Arduino Uno schematics.

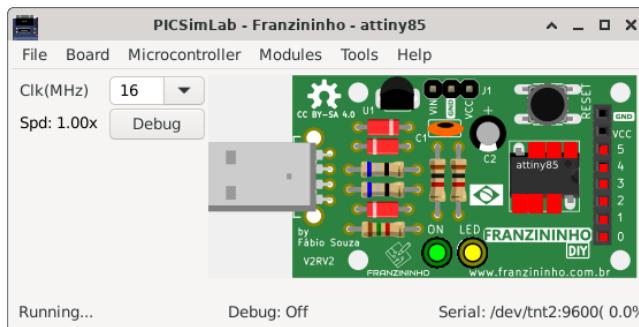

The code examples can be loaded in PICSimLab menu **Help->Examples**.

The source code of board Arduino Uno examples using the [Arduino IDE with avr-gcc](#) are in the link: [board\\_Arduino\\_Uno](#).

More information about the Arduino in [www.arduino.cc](#)

## 4.8 Franzininho

The Franzininho DIY board is an openhardware project, more info at <https://franzininho.com.br/>. It was developed to be used with the microcontroller ATtiny85 of of [simavr](#).

#### Examples

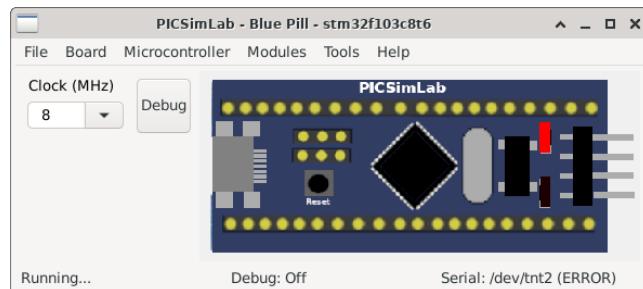

# Chapter 5

## Experimental Boards

Boards in the experimental phase. Probably with some bugs and missing features.

### 5.1 Blue Pill

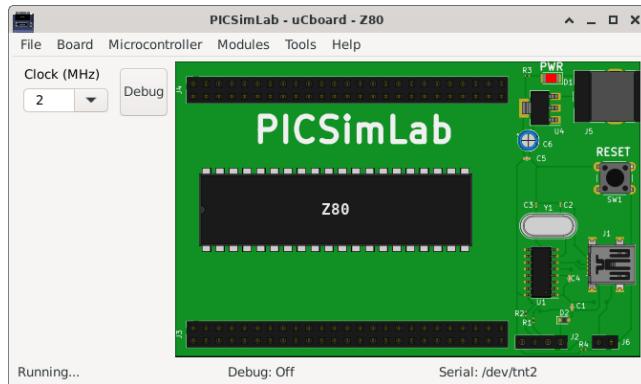

It is a generic board only with reset, serial and crystal circuits and support to stm32f103c8t6 microcontroller of [qemu-stm32](#).

[Examples](#)

### 5.2 uCboard

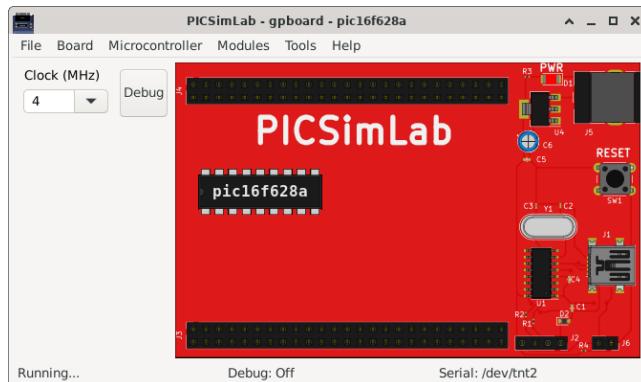

It is a generic board only with reset, serial and crystal circuits and support to multiple microcontrollers (initially C51, Z80 and STM8S103 )of [uCsim](#).

[Examples](#)

### 5.3 gpboard

It is a generic board only with reset, serial and crystal circuits and support to multiple microcontrollers of [gpsim](#).

[Examples](#)

### 5.4 STM32 H103

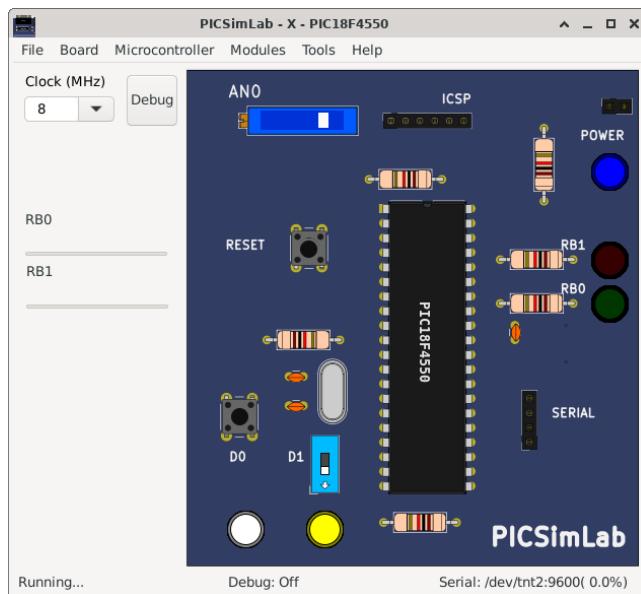

It is a generic board only with reset, one push button, serial and crystal circuits and support to stm32f103rbt6 microcontroller of [qemu-stm32](#).

### Examples

## 5.5 X

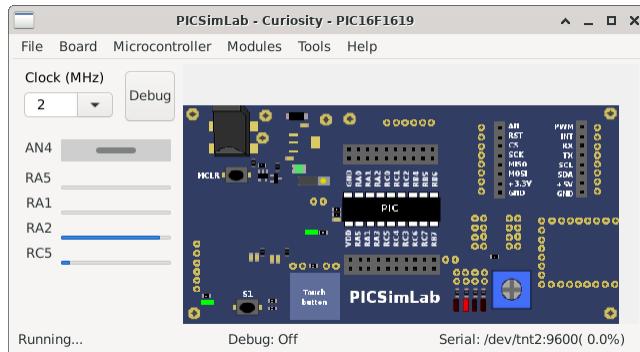

It is a generic board, used as example in [How to Compile PICsimLab and Create New Boards](#).

### Examples

## 5.6 Curiosity

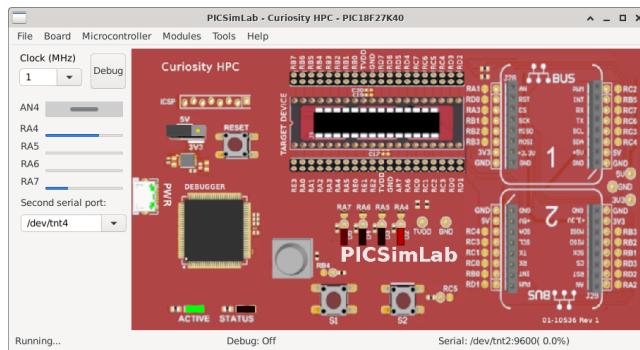

This is a simple PIC microcontroller development board that uses [picsim](#).

[Examples](#)

## 5.7 Curiosity HPC

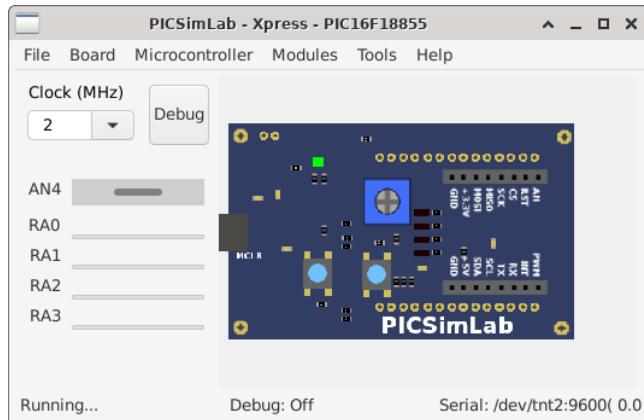

This is a simple PIC microcontroller development board that uses [picsim](#).

[Examples](#)

## 5.8 Xpress

This is a simple PIC microcontroller development board that uses [picsim](#).

[Examples](#)

## Chapter 6

# Serial Communication

To use the simulator serial port, install a NULL-MODEM emulator:

- Windows: com0com <http://sourceforge.net/projects/com0com/>
- Linux: tty0tty <https://github.com/lcgamboa/tty0tty>

For communication the PICSimLab should be connected in one port of the NULL-MODEM emulator and the other application connected in the other port. Configuration examples linking PICSimLab to [CuteCom](#) for serial communication:

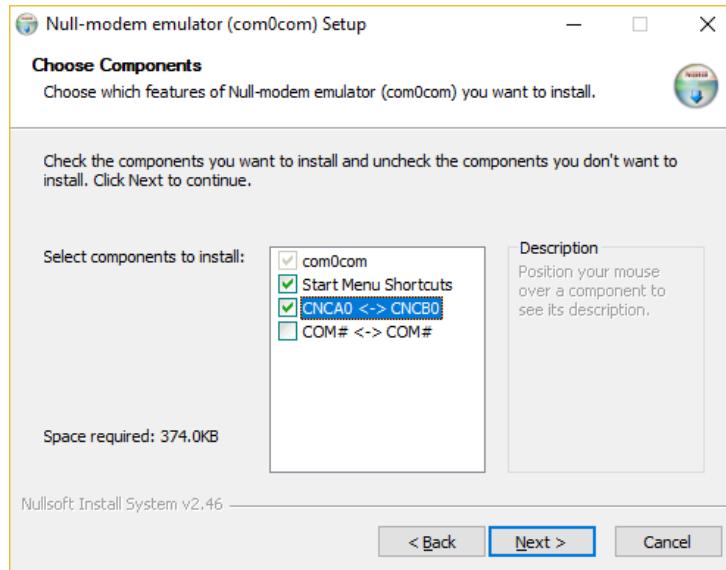

OS	PicsimLab port	CuteCom port	NULL-Modem prog.	Connection
Windows	com1	com2	com0com	com1<=>com2
Linux	/dev/tnt2	/dev/tnt3	tty0tty	/dev/tnt2<=>/dev/tnt3

### 6.1 Com0com Installation and Configuration(Windows)

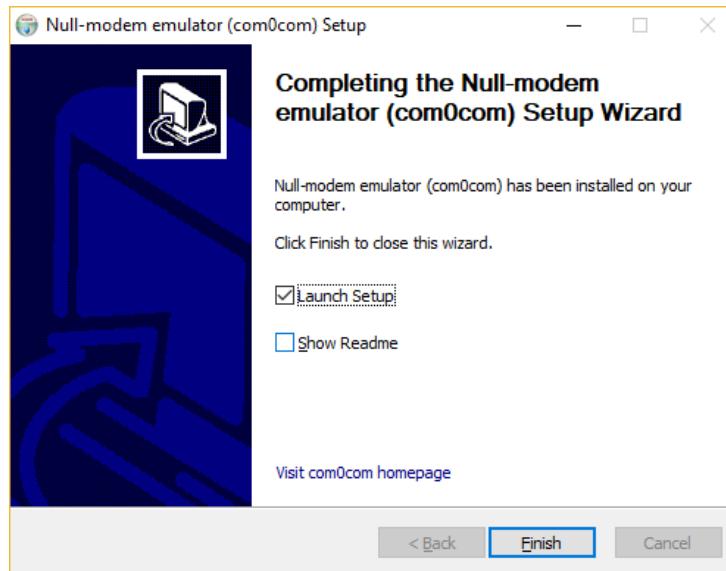

Download the signed version of [com0com](#).

Unzip the downloaded .zip file and run the specific installer of your operating system, x86 for windows 32-bit or x64 for windows 64-bit.

Configure the “choose components” window as the figure below:

In the last configuration window, check the “Launch setup” option:

In the setup window, change the port names to COM1, COM2, COM3 .... Just check the “enable buffer overrun” option on the two ports, click in the “Apply” button and close the setup. In the configuration shown in the figure below, the COM1 and COM2 ports form a NULL-MODEM connection, where one port must be used by the PICSimLab and another by the application with serial communication.

## 6.2 tty0tty Installation and Configuration (Linux)

Download the [tty0tty](#). Unzip the downloaded folder.

Open a terminal and enter in the `tty0tty/module/` folder and enter the following commands:

```
sudo apt-get update
sudo apt-get -y upgrade
sudo apt-get -y install gcc make linux-headers-`uname -r`
sudo ./dkms-install.sh
sudo modprobe tty0tty
```

The user must be in the **dialout** group to access the ports. To add your user to **dialout** group use the command:

```
sudo usermod -a -G dialout your_user_name
```

after this is necessary logout and login to group permissions take effect.

Once installed, the module creates 8 interconnected ports as follows:

```
/dev/tnt0  <=>  /dev/tnt1
/dev/tnt2  <=>  /dev/tnt3
/dev/tnt4  <=>  /dev/tnt5
/dev/tnt6  <=>  /dev/tnt7
```

the connection between each pair is of the form:

TX	->	RX
RX	<-	TX
RTS	->	CTS
CTS	<-	RTS
DSR	<-	DTR
CD	<-	DTR
DTR	->	DSR
DTR	->	CD

Any pair of ports form a NULL-MODEM connection, where one port must be used by the PICSimLab and another by the application with serial communication.

# Chapter 7

## Debug Support

The type of debug interface depends on the backend simulator utilized.

### 7.1 MPLABX Integrated Debug (picsim and simavr)

To use the [MPLABX](#) IDE for debug and program the PicsimLab, install the plugin [com-picsim-picsimlab.nbm](#) in MPLABX.

The plugin connect to Picsimlab through a TCP socket using port 1234 (or other defined in configuration window), and you have to allow the access in the firewall.

[Tutorial: how to use MPLABX to program and debug PICsimLab.](#)

It's possible import and debug a Arduino sketch into MPLABX using the [Arduino import plugin](#).

### 7.2 Arduino IDE Integration (simavr)

For integrated use with the Arduino IDE, simply configure the serial port as explained in the section [6](#) and load the Arduino bootloader. The bootloader can be loaded from the “Tools->Arduino bootloader” menu.

In Windows, considering com0com making a NULL-MODEM connection between COM1 and COM2, simply connect the PICSimLab on the COM1 port (defined in configuration window) and the Arduino IDE on the COM2 port or vice versa.

On Linux the operation is the same, but using for example the ports /dev/tnt2 and /dev/tnt3.

In Linux for the virtual ports to be detected in Arduino it is necessary to replace the library lib/liblistSerialsj.so of the Arduino with a version which support the detection of tty0tty ports, that can be downloaded in the link [listSerialC with tty0tty support](#).

### 7.3 avr-gdb Debug (simavr)

With debug support enabled you can use avr-gdb to debug the code used in the simulator. Use the configuration window to choose between MDB (MPLABX) or GDB to debug AVR microcontrollers.

Use avr-gdb with the .elf file as the parameter:

```
avr-gdb compiled_file.elf
```

and the command below to connect (1234 is the default port):

```
target remote localhost:1234
```

Graphic debug mode can be made using [eclipse IDE](#) with Sloeber Arduino plugin.

### 7.4 arm-gdb Debug (qemu-stm32)

With debug support enabled you can use arm-none-eabi-gdb (or gdb-multiarch) to debug the code used in the simulator.

Use arm-none-eabi-gdb with the .elf file as the parameter:

```
arm-none-eabi-gdb compiled_file.elf
```

and the command below to connect (1234 is the default port):

```
target remote localhost:1234
```

Graphic debug mode can be made using [eclipse IDE](#) with Eclipse Embedded CDT.

### 7.5 uCsim Debug

The uCsim debug console can be accessed with the telnet (1234 is the default port):

```
telnet localhost 1234
```

All [uCsim commands](#) are supported.

For windows users [putty telnet client](#) is a good option to access the uCsim console.

# Chapter 8

## Tools

### 8.1 Serial Terminal

Open the serial terminal [CuteCom](#).

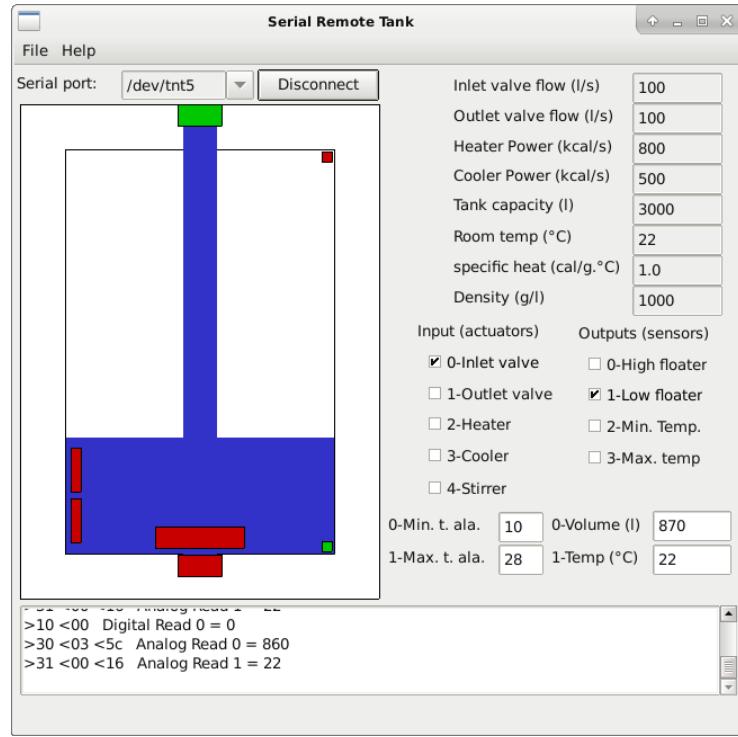

A serial terminal is used to send and receive data over a serial communication channel. The use of this terminal can be replaced by others like the Arduino IDE serial monitor.

To use this tool with PICSimLab you first need to configure a virtual serial port as described in Chapter: [Serial Communication](#). It is possible to use this tool with a real serial port connected to a real device.

### 8.2 Serial Remote Tank

The serial remote tank is a tank simulator controlled by a serial communication protocol. The tank has several sensors and actuators that can be read and controlled using

the communication protocol. The parameters of the serial communication port must be 19200 8N1.

To use this tool with PICSimLab you first need to configure a virtual serial port as described in Chapter: [Serial Communication](#). It is possible to use this tool with a real serial port connected to a real device.

### 8.2.1 Actuators

Digital inputs:

1. Inlet valve
2. Outlet valve
3. Heater
4. Cooler
5. Stirrer

Analog inputs:

1. Minimal temperature alarm trigger level
2. Maximal temperature alarm trigger level

### 8.2.2 Sensors

Digital outputs:

1. High floater
2. Low floater
3. Minimal temperature
4. Maximal temperature

Analog outputs:

1. Volume
2. Temperature

### 8.2.3 Communication Protocol

#### Writing on Digital Input

Sent one byte in 0x0N hexadecimal format where N is the number of input followed by a second byte with value 0x00 for disable or 0x01 for enable.

Example to turn on the input 2:

```
Serial_write(0x02);
Serial_write(0x01);
```

#### Reading Digital Output

Sent one byte in 0x1N hexadecimal format where N is the number of output and read one byte. The byte readed have value 0x00 for disable or 0x01 for enable.

Example to read output 3:

```
Serial_write(0x13);
valor=Serial_read();
```

#### Writing on Analog Input

Sent one byte in 0x2N hexadecimal format where N is the number of input followed by two bytes with the 16 bits value.

Example to write the value 230 on analog input 1:

```
Serial_write(0x21);
valor=230;
Serial_write((valor&0xFF00)>>8);
Serial_write(valor&0x00FF);
```

### Reading Analog Output

Sent one byte in 0x3N hexadecimal format where N is the number of output and read two bytes to form the 16 bits value.

Example to read analog output 2:

```
Serial_write(0x32);
valorh=Serial_read(0);
valorl=Serial_read(0);
valor=(valorh<<8)|valorl;
```

## 8.3 Esp8266 Modem Simulator

The ESP8266 modem simulator emulates the operation of an esp8266 with wifi modem firmware. Communication is done using a serial channel via AT modem commands. The parameters of the serial communication port must be 115200 8N1.

To use this tool with PICSimLab you first need to configure a virtual serial port as described in Chapter: [Serial Communication](#). It is possible to use this tool with a real

serial port connected to a real device.

### 8.3.1 Supported Commands

- AT
- AT+RST
- AT+GMR
- AT+CWMODE=1
- AT+CWDHCP=1,1
- AT+CWLAP
- AT+CWJAP="rede1","123456"
- AT+CIFSR
- AT+CIPMUX=1
- AT+CIPSERVER=1,2000
- AT+CIPSEND=0,10
- AT+CIPCLOSE=0

## 8.4 Arduino Bootloader

This menu option load PICSimLab microcontroller with Arduino serial bootloader. The microcontroller with the bootloader loaded can be programmed directly by the Arduino IDE or using the avrdude program.

To use this tool with PICSimLab you first need to configure a virtual serial port as described in Chapter: [Serial Communication](#).

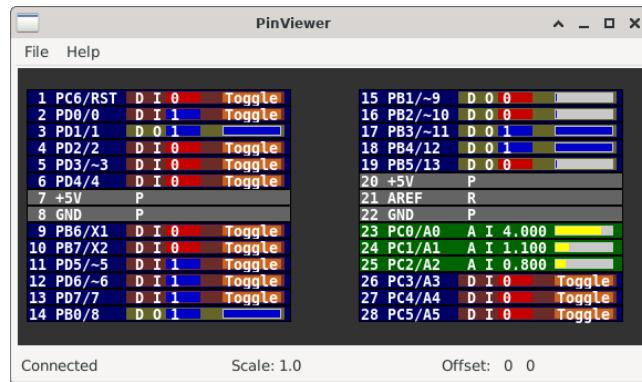

## 8.5 MPLABX Debugger Plugin

This menu option open the web page to download the MPLABX Debugger Plugin.

The plugin must be installed on MPLABX to allow debugging and programming PICSimLab (PICs and AVRs) from the IDE, like a real tool for debugging and programming.

## 8.6 Pin Viewer

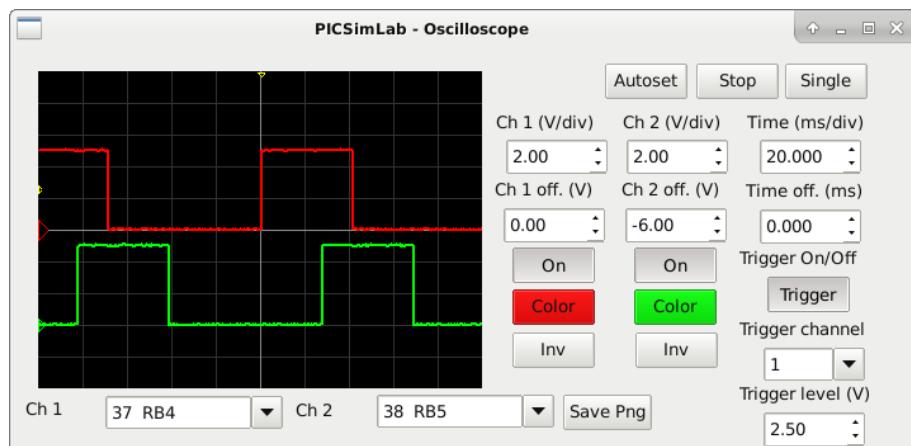

The PinViewer connects to PICSimLab through the **rcontrol interface** and allows viewing the status and direction of all microcontroller pins. It is also possible to change the state of the digital pins and adjust the voltage value on the analog pins configured as input. Pins configured as outputs also show the average value, useful for evaluating the functioning of PWM outputs.

# Chapter 9

## Oscilloscope

The PICSimLab has a basic two-channel oscilloscope that can be used to view the signal on any pin of the microcontroller. The oscilloscope can be accessed through the “Modules->Oscilloscope” menu.

# **Chapter 10**

## **Spare Parts**

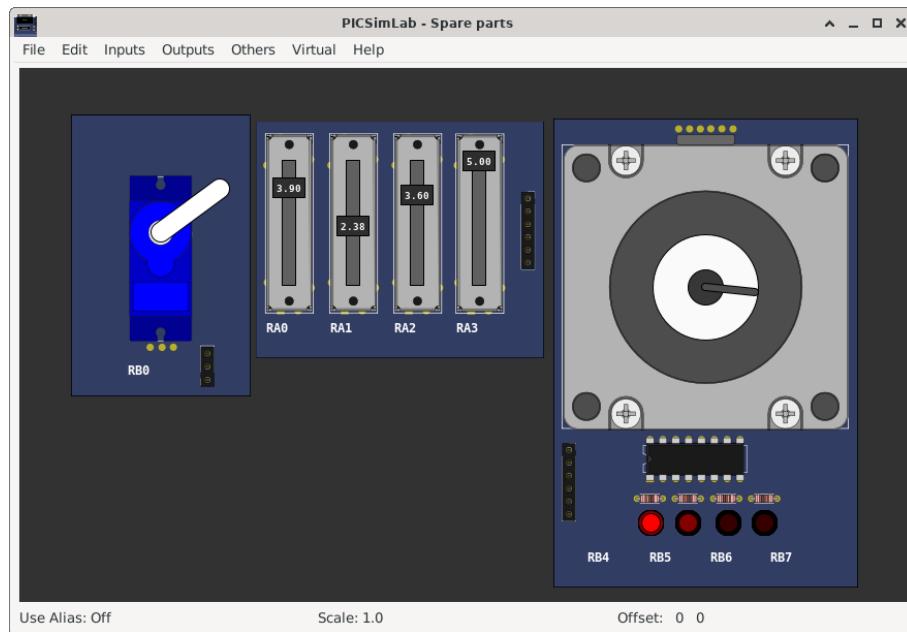

The PICSimLab has a window that allows the connection of spare parts to the microcontroller, it can be accessed through the menu “ Modules-> Spare parts ”.

The main window has the menu with the following functions:

- File
  - New configuration - Clear the spare parts window
  - Save configuration - Saves the current settings of the spare parts into .pcf file
  - Load configuration - Loads the settings from .pcf file
  - Save pin alias - Saves the current pin alias to .ppa text file
  - Load pin alias - Loads the pin alias from .ppa file
- Edit
  - Clear pin alias - Clear the pin alias
  - Toggle pin alias - Enable/Disable pin alias use
  - Edit pin alias - Open current pin alias .ppa file in text editor
  - Reload pin alias - Reload the current .ppa pin alias file (need after edit .ppa file)
  - Zoom in - Increase draw scale
  - Zoom out - Decrease draw scale
- Inputs
  - Encoder - Adds a rotary quadrature encoder with push button
  - FM50 (Temperature) - Adds a analog temperature sensor
  - Fixed Voltage - Adds a analog fixed voltage reference
  - Gamepad - Adds a gamepad

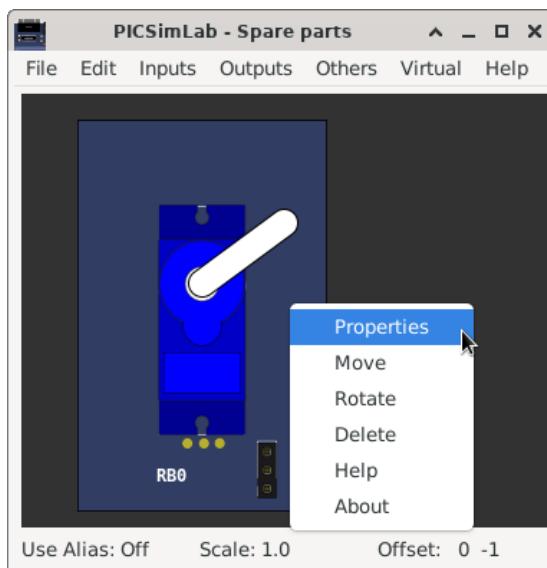

- Gamepad (Analogic) - Adds a gamepad with one analogic output
- Keypad - Adds one matrix keypad
- LM35 (Temperature) - Adds a analog temperature sensor
- MPU6050 - Adds a accelerometer and gyroscope (only raw values)
- Potentiometers - Adds 4 potentiometers
- Potentiometers (Rotary) - Adds 4 rotary potentiometers
- Push Buttons - Adds 8 push buttons
- Push Buttons (Analogic) - Adds 8 push buttons with analog output
- SHT3X - Adds a analog temperature and humidity sensor
- Switchs - Adds eight switchs
- Ultrasonic HC-SR04 - Adds a ultrasonic range sensor
- Outputs
  - 7 Segments Display - Adds four multiplexed 7 segments displays
  - 7 Segments Display (w/dec) - Adds four multiplexed 7 segments displays with decoder
  - Buzzer - Adds a active/passive buzzer
  - DC Motor - Adds a DC motor with H-bridge and quadrature encoder
  - LCD hd44780 - Adds a text display hd44780
  - LCD ili9340 - Adds a color graphic display ili9340 with touchscreen
  - LCD pcd8544 - Adds a monochrome graphic display pcd8544 (Nokia 5110)
  - LCD pcf8833 - Adds a color graphic display pcf8833
  - LCD ssd1306 - Adds a monochrome graphic display ssd1306
  - LED Matrix - Adds a 8x8 LED matrix with MAX72xx controller
  - LEDs - Adds 8 red LEDs
  - RGB LED - Adds one RGB LED
  - Servo Motor - Adds a servo motor
  - Step Motor - Adds a step motor
- Others
  - ETH w5500 - Adds a ethernet shield w5500
  - IO 74xx595 - Adds a 74xx595 SIPO 8 bit shift register
  - IO MCP23S17 - Adds a MCP23S17 serial SPI IO expander
  - IO PCF8574 - Adds a PCF8574 serial I2C IO expander
  - IO UART - Adds a UART serial port
  - Jumper Wires - Adds sixteen jumper wires

- MEM 24CXXX - Adds a 24CXXX serial I2C EEPROM memory
- RTC ds1307 - Adds a ds1307 real time clock
- RTC pfc8563 - Adds a pfc8563 real time clock
- SD Card - Adds a SD card shield
- Temperature System - Adds a temperature control system
- Virtual
  - D. Transfer Function - Adds a discrete transfer function mathematical model
  - IO Virtual term - Adds a virtual serial terminal
  - Signal Generator - Adds a virtual signal generator
  - VCD Dump - Adds a digital value file dump recorder
  - VCD Dump (Analogic) - Adds a analog value file dump recorder
  - VCD Play - Adds a digital value file dump player
- Help
  - Contents - Open Help window
  - About - Show message about author and version

After adding the part, with a right click of the mouse you can access the options menu of the part with the options:

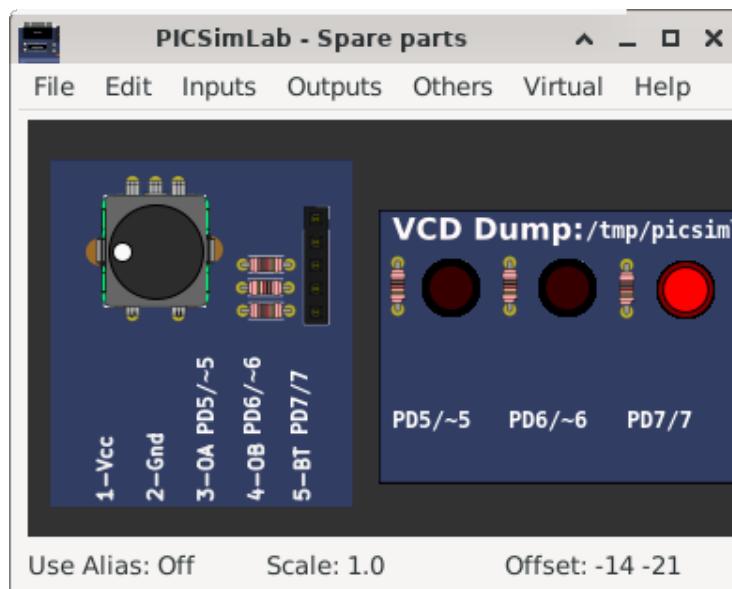

- Properties - Opens the connection settings window
- Move - Unlocks the part to move
- Rotate - Change the orientation of part
- Delete - Remove part
- Help - Open Help window of part
- About - Show message about author and version of part

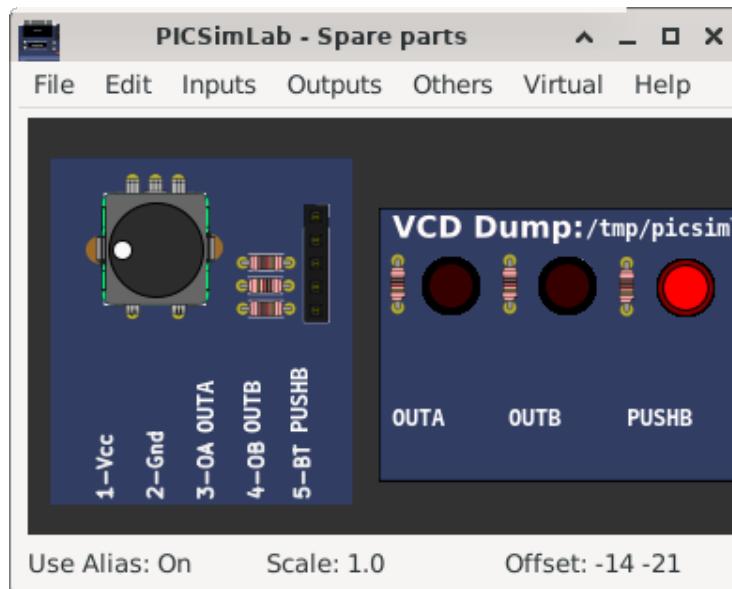

## 10.1 Pin Alias

The pin alias support allows the user to place custom names on the pins making it easy to identify according to the project.

When off the normal names are shown:

When on the alias names are shown:

To use:

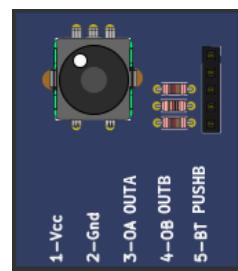

1. active the menu “Edit->Clear pin alias” to reset the pin alias file
2. active the menu “Edit->Edit pin alias” to open pin alias file, change the names, save and close.

3. active the menu “Edit->Reload pin alias” to load new alias
4. active the menu “Edit->Toggle pin alias” to show new alias

## 10.2 Inputs

### 10.2.1 Encoder

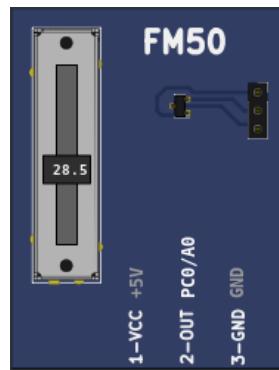

This part is a rotary quadrature encoder with push button. The output is twenty pulses per revolution.

[Examples](#)

### 10.2.2 FM50 (Temperature)

This part is FM50 analog temperature sensor. The measurement range is -40 to 125 °C and voltage output is 10mV/°C + 500mV.

[Examples](#)

### 10.2.3 Fixed Voltage

This part is analog fixed voltage reference. The value range is 0 to 5V.

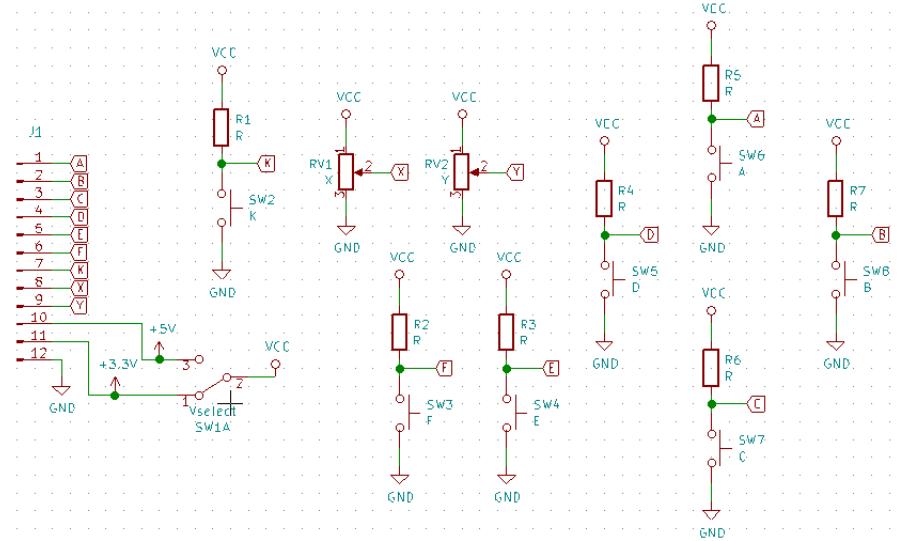

#### Examples

##### 10.2.4 Gamepad

This part is a gamepad with two analog axis and 7 push buttons.

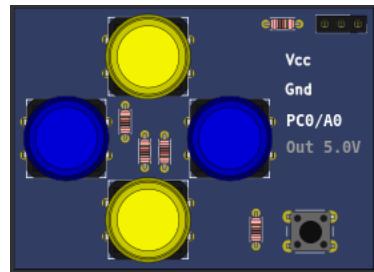

The gamepad can be controlled by keyboards keys:

- X axis - keys 'A' and 'D'
- Y axis - keys 'W' and 'S'
- Button A - key 'I'
- Button B - key 'L'
- Button C - key 'K'
- Button D - key 'J'
- Button E - key 'E'
- Button F - key 'O'
- Button K - key 'R'

#### Examples

##### 10.2.5 Gamepad Analogic

This part is a gamepad with 5 push buttons and one analog output.

The gamepad can be controlled by keyboards keys:

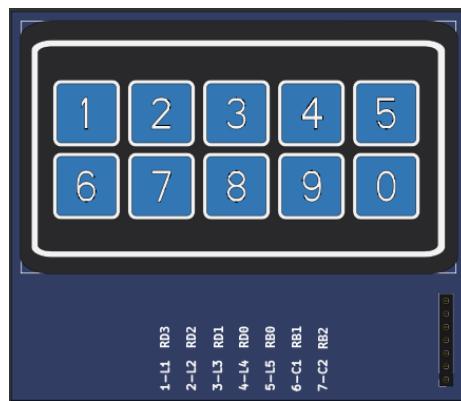

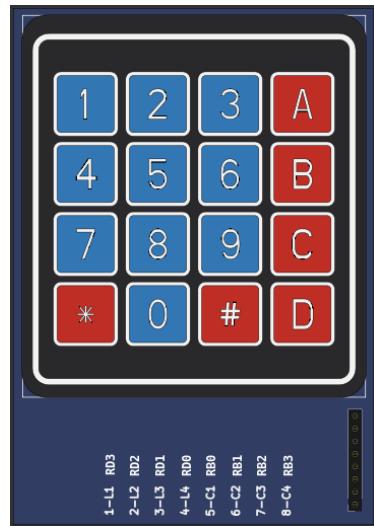

- Button A - key 'L'
- Button B - key 'I'
- Button C - key 'K'
- Button D - key 'J'
- Button E - key 'O'

#### [Examples](#)

#### **10.2.6 Keypad**

It is a matrix keyboard configurable to 4x3 , 4x4 or 2x5 rows/columns.

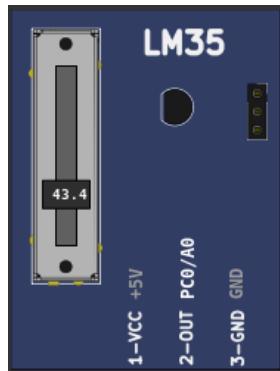

### Examples

#### 10.2.7 LM35 (Temperature)

This part is LM35 analog temperature sensor. The measurement range is 2 to 150 °C and voltage output is 10mV/°C.

[Examples](#)

### 10.2.8 MPU6050

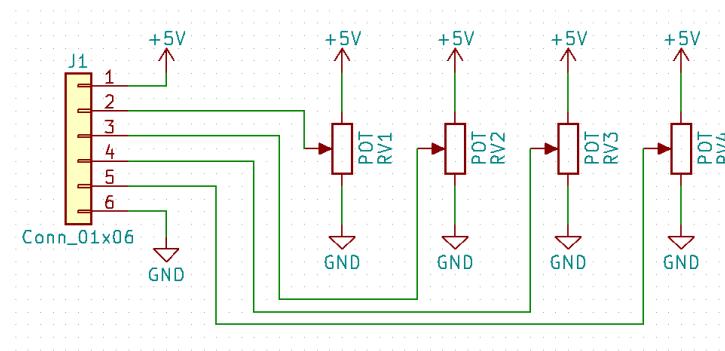

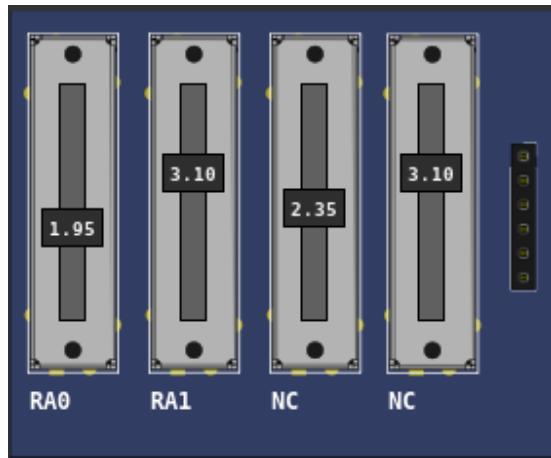

This part is MPU6050 accelerometer and gyroscope with I2C interface. Only raw values are available, DMP is not supported.

[Examples](#)

### 10.2.9 Potentiometers

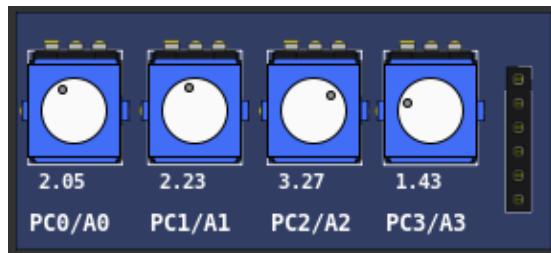

This part is formed by 4 potentiometers connected between 0 and 5 volts, the output is connected to the cursor and varies within this voltage range.

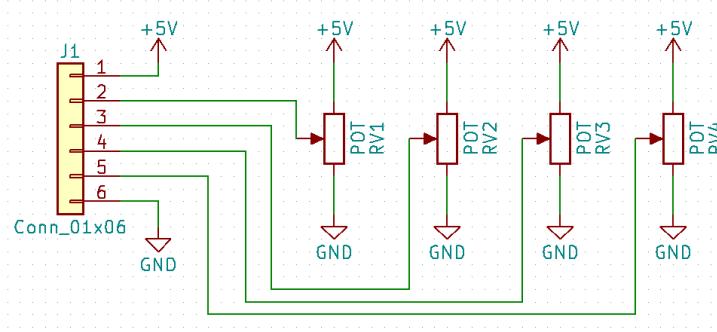

Examples

### 10.2.10 Potentiometers (Rotary)

This part is formed by 4 rotary potentiometers connected between 0 and 5 volts, the output is connected to the cursor and varies within this voltage range.

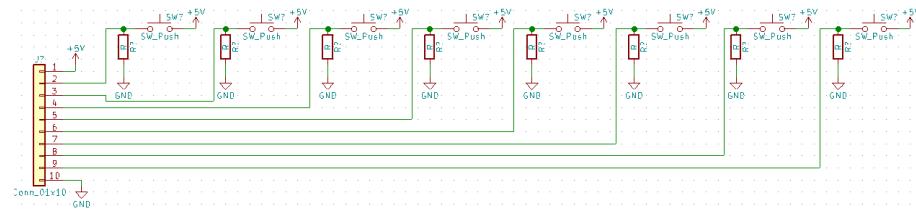

Examples

### 10.2.11 Push Buttons

This part consists of 8 push buttons. The output active state can be configurable.

Examples

### 10.2.12 Push Buttons (Analogic)

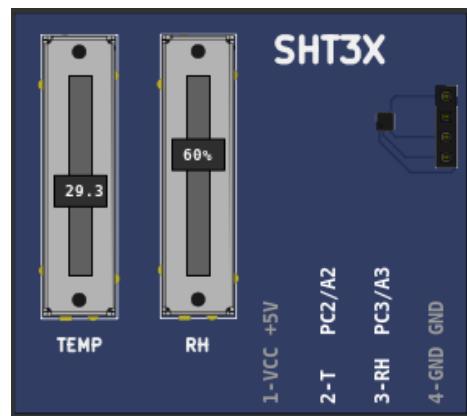

This part consists of 8 push buttons connected in a resistive ladder.

### Examples

#### 10.2.13 SHT3X (Temp. Hum.)

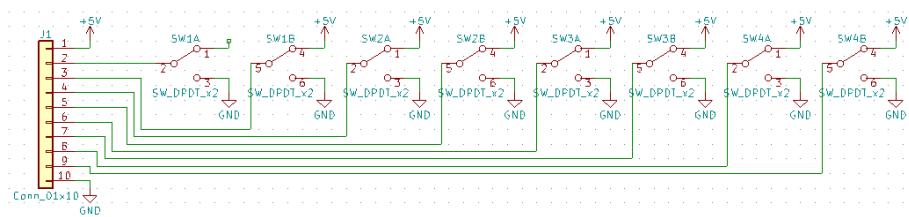

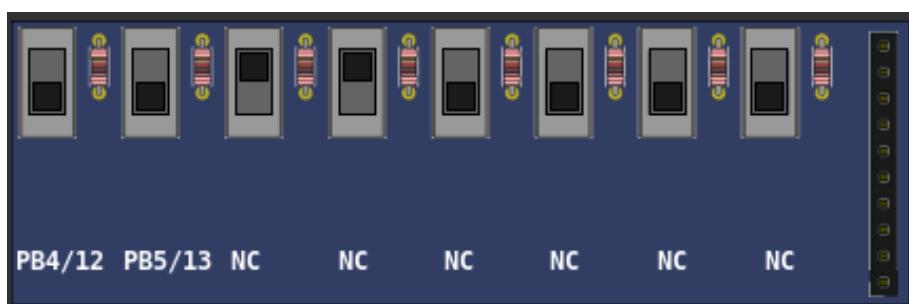

This part is SHT3X analog temperature and humidity sensor. The temperature range is -40 to 125 °C and voltage output is 22.85mV/°C + 1.53V . The relative humidity range is 0 to 100 % and voltage output is 40mV/% + 500mV.

### Examples

#### 10.2.14 Switches

This part consists of 8 keys with on or off position (0 or 1).

[Examples](#)

### 10.2.15 Ultrasonic HC-SR04

This part is ultrasonic range meter sensor.

[Examples](#)

## 10.3 Outputs

### 10.3.1 7 Segments Display

This is a four multiplexed 7 segments displays.

[Examples](#)

### 10.3.2 7 Segments Display (Decoder)

This is a four multiplexed 7 segments displays with BCD to 7 segments decoder (CD4511).

[Examples](#)

### 10.3.3 Buzzer

This is a active/passive buzzer.

[Examples](#)

### 10.3.4 DC Motor

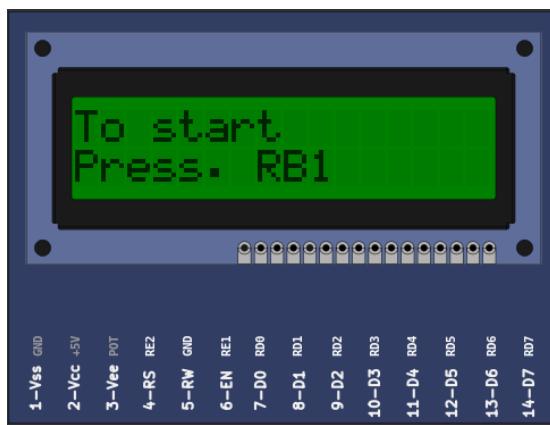

This part is DC motor with H-bridge driver and quadrature encoder.

### Examples

#### 10.3.5 LCD hd44780

This part is a text display with 2 (or 4) lines by 16 (or 20) columns.

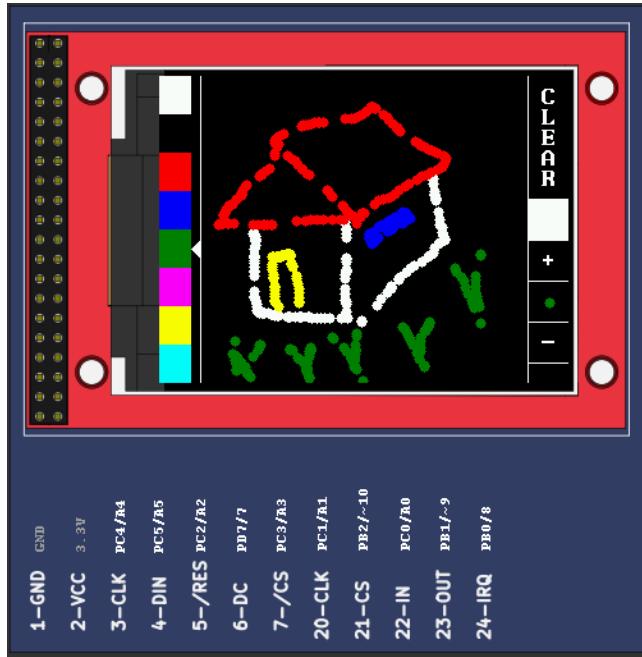

### Examples

#### 10.3.6 LCD ili9341

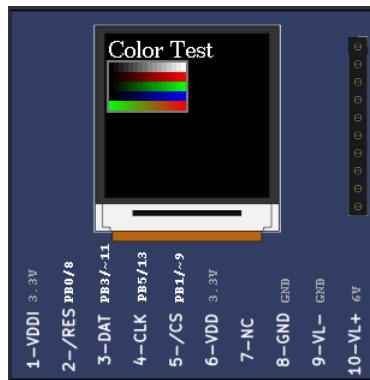

This part is a color graphic display with 240x320 pixels with touchscreen (xpt2046 controller). Only 4 SPI mode and 8 bits parallel mode is available.

[Examples](#)

### 10.3.7 LCD pcf8833

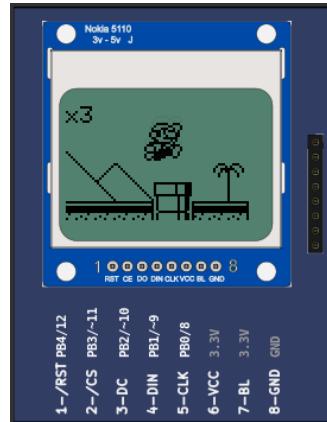

This part is a color graphic display with 132x132 pixels.

[Examples](#)

### 10.3.8 LCD pcd8544

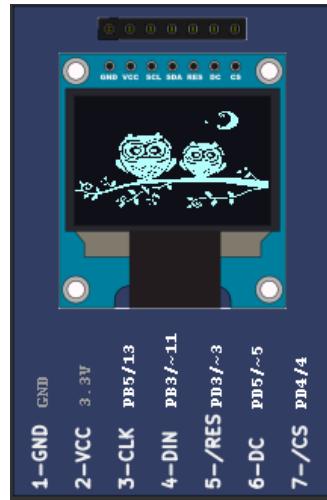

This part is a monochrome graphic display with 48x84 pixels. (Nokia 5110)

[Examples](#)

### 10.3.9 LCD ssd1306

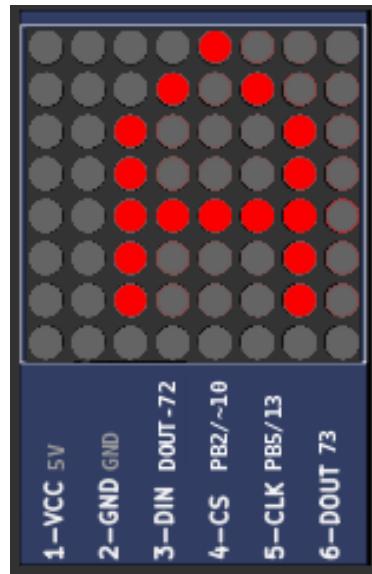

This part is a monochrome oled graphic display with 128x64 pixels. The part support I2C and 4 SPI serial mode.

[Examples](#)

### 10.3.10 LED Matrix

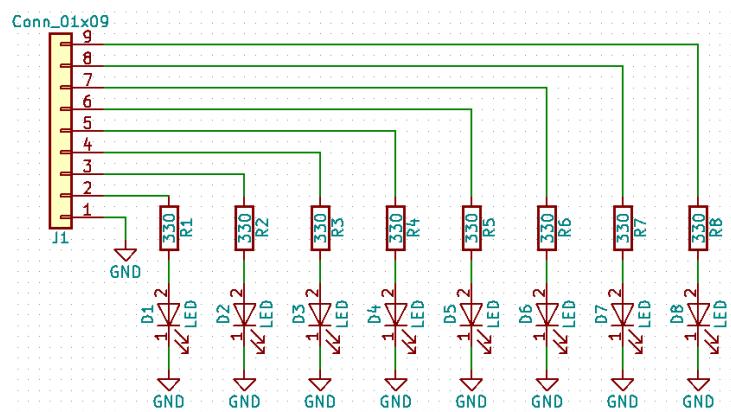

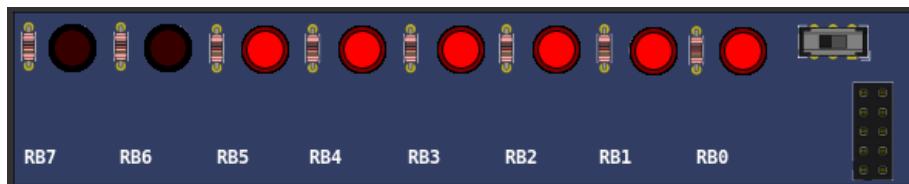

It is a 8x8 LED matrix with MAX72xx controller.

Examples

### 10.3.11 LEDs

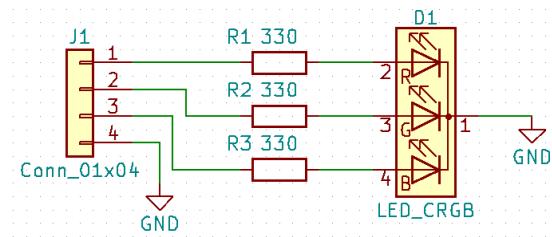

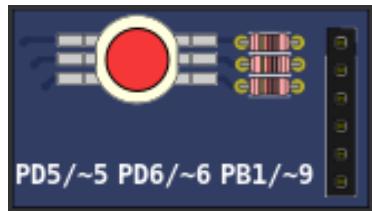

This part is a bar of 8 independent red LEDs.

### Examples

#### 10.3.12 RGB LED

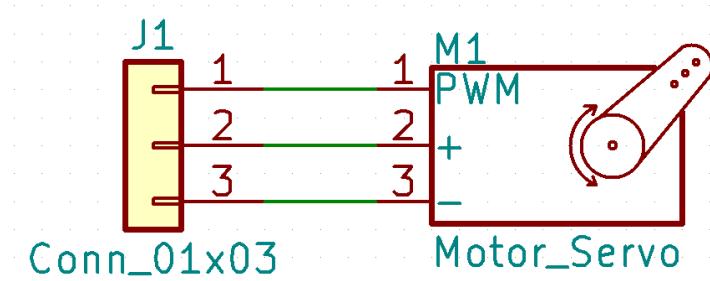

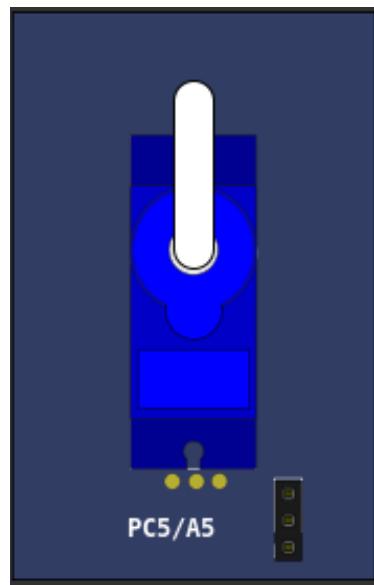

This part consists of a 4-pin RGB LED. Each color can be triggered independently. Using PWM it is possible to generate several colors by combining the 3 primary colors.

### Examples

#### 10.3.13 Servo Motor

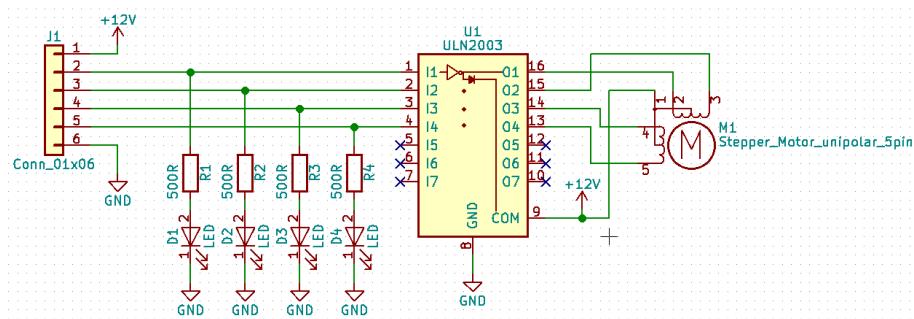

The servo motor is a component that must be activated with a pulse of variable width from 1ms to 2ms every 20 ms. A pulse of 1ms positions the servo at -90°, one from 1.5ms to 0° and one from 2ms to 90°.

### Examples

#### 10.3.14 Step Motor

The stepper motor is a component with 4 coils that must be driven in the correct order to rotate the rotor. Each step of the motor is  $1.8^\circ$ .

Examples

## 10.4 Others

### 10.4.1 ETH w5500

This part is a ethernet shield w5500 with support to 8 sockets simultaneously.

Only TCP/UDP unicast address sockets is supported. DHCP is emulated and return a fake ipv4 address.

All listening ports below 2000 are increased by 2000 to avoid operational system services ports. For example listening on port 80 becomes 2080.

w5500 Status Legend:

1º Letter - Type	2º Letter - Status	3º Letter - Error
C - Closed	C - Closed	B - Bind
T - TCP	I - Initialized	S - Send
U - UDP	L - Listen	R - Receive
M - MACRAW (don't supported)	S - Syn sent	L - Listen
	E - Established	U - Reuse
	W - Close wait	C - Connecting
	U - UDP	D - Shutdown
	M - MACRAW (don't supported)	

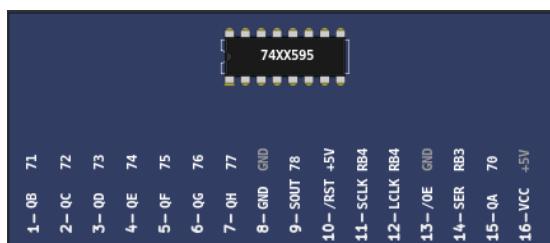

Click on connector to toggle link status.

Examples

#### 10.4.2 IO 74xx595

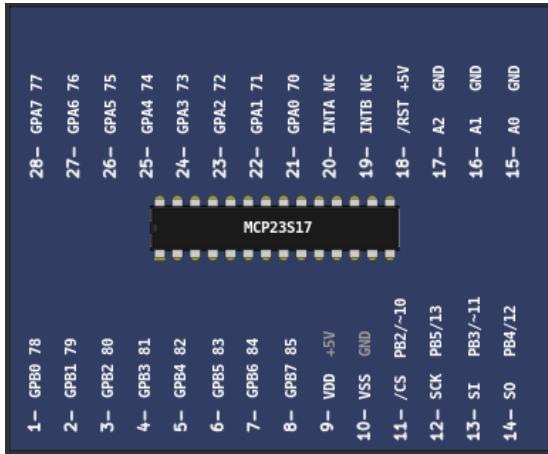

This is one 74xx595 serial input and parallel output 8 bit shift register.

Examples

### 10.4.3 IO MCP23S17

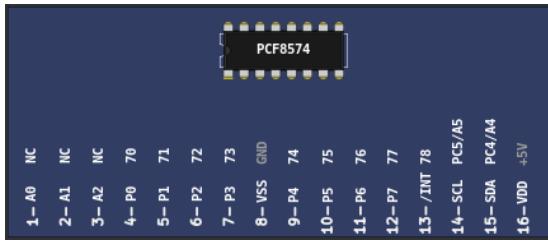

It is a MCP23S17 serial SPI IO expander part.

[Examples](#)

### 10.4.4 IO PCF8574

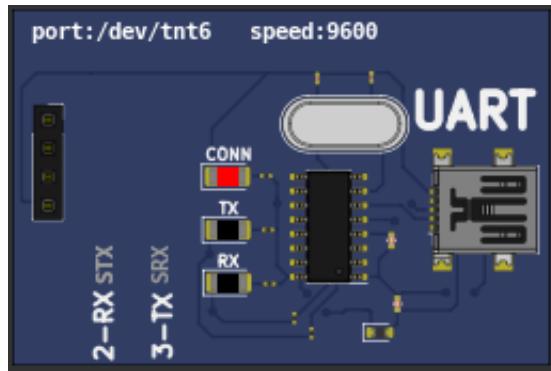

It is a PCF8574 serial I2C IO expander.

[Examples](#)

### 10.4.5 IO UART

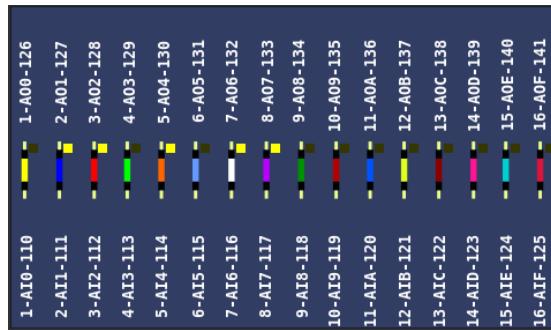

This part is a UART serial port. This part connects the hardware/software UART IO pins of microcontroller to one real/virtual PC serial port. To use virtual port is need to install a virtual port software, as described in [6](#).

[Examples](#)

#### 10.4.6 Jumper Wires

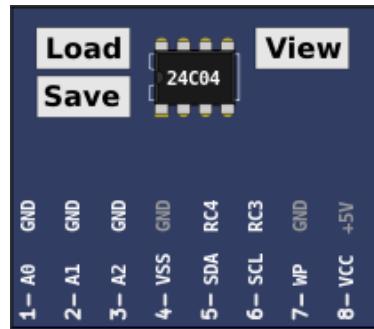

This part are formed by sixteen jumper wires. Each jumper has one input and one output. The jumper input must be connected to one pin output, the jumper output can be connected to multiple pin inputs. The jumper can be used to connect microcontroller pins or make connection between spare parts pins.

[Examples](#)

#### 10.4.7 MEM 24CXXX

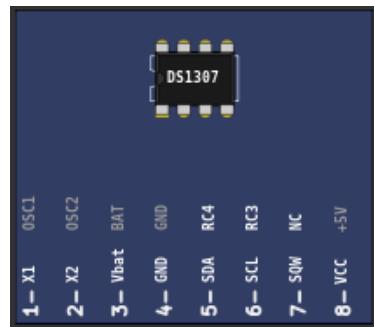

It is a 24CXXX serial I2C EEPROM part. There are support to the models 24C04 and 24C512.

[Examples](#)

#### 10.4.8 RTC ds1307

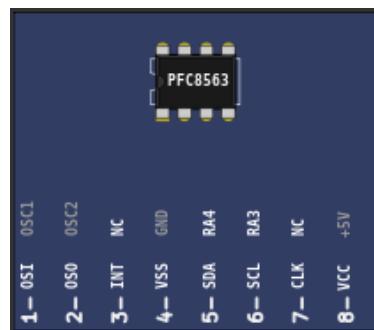

This part is a ds1307 real time clock with serial I2C interface.

[Examples](#)

#### 10.4.9 RTC pfc8563

This part is a pfc8563 real time clock with serial I2C interface.

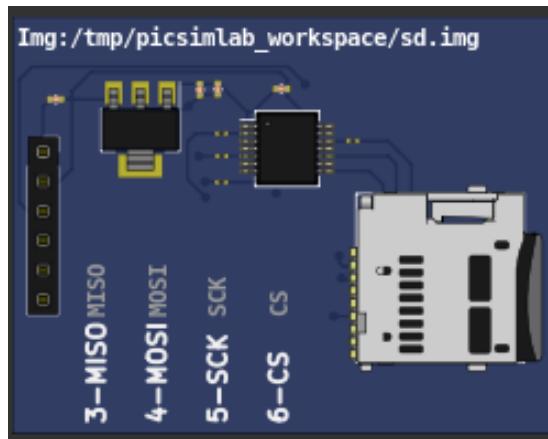

[Examples](#)**10.4.10 SD Card**

This part is a SD Card shield. It's necessary set one sd card file image before use it.  
(Click on SD card connector to open file dialog)

On Linux one empty image can be created with this command:

```
dd if=/dev/zero of=sd.img bs=1M count=32
```

This empty image can be used with raw sd card access, to work with FAT file system  
the image need to be formatted before the use. (using [SdFormatter.ino](#) for example)

[Examples](#)**10.4.11 Temperature System**

This part is a temperature control system. The temperature control system consists of a heating resistor, an LM35 temperature sensor, a cooler and an infrared tachometer.

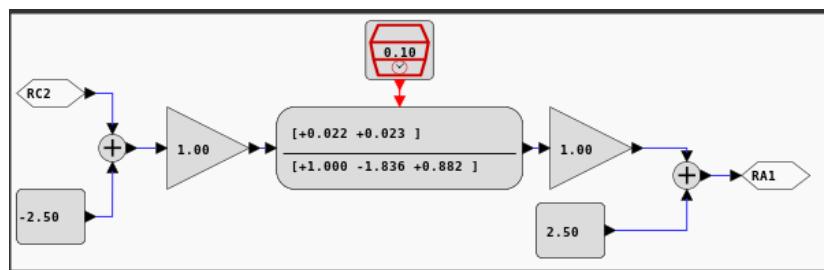

[Examples](#)

## 10.5 Virtual

### 10.5.1 D. Transfer Function

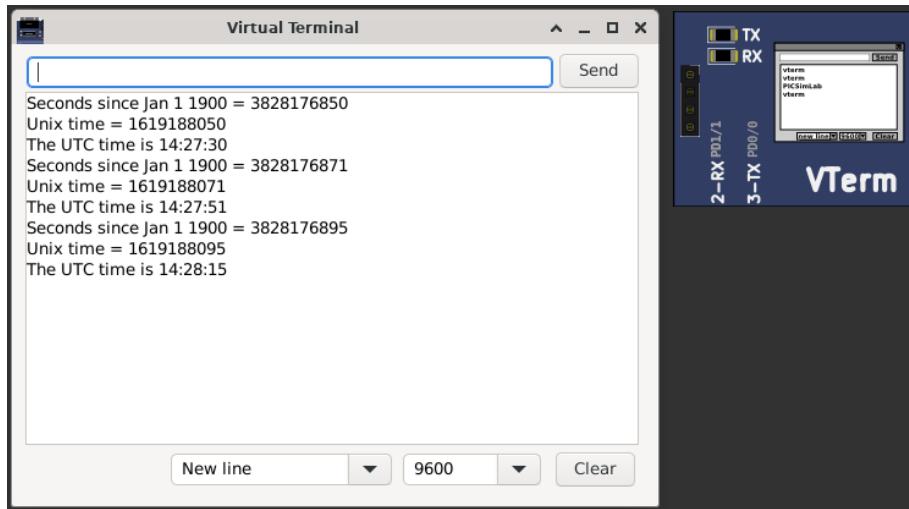

This is a discrete transfer function mathematical model.

[Examples](#)

### 10.5.2 IO Virtual Term

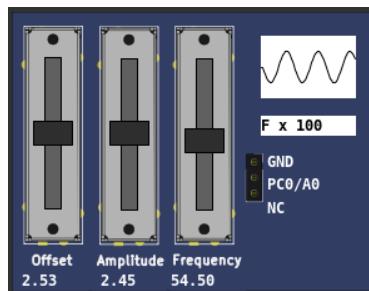

This part is a virtual serial terminal. This part can be used to read and write RX/TX pins UART signals. This part don't need the use or install of virtual serial ports on computer. Clik on terminal picture to open the terminal window.

### Examples

#### 10.5.3 Signal Generator

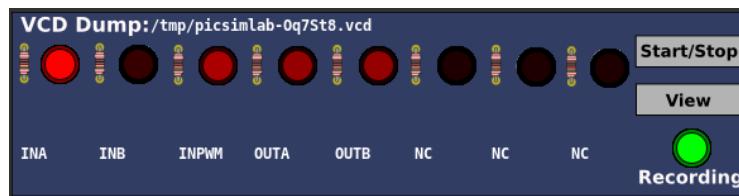

This part is a virtual signal generator with support for sine, square and triangular waves generation with amplitude and frequency adjustment.

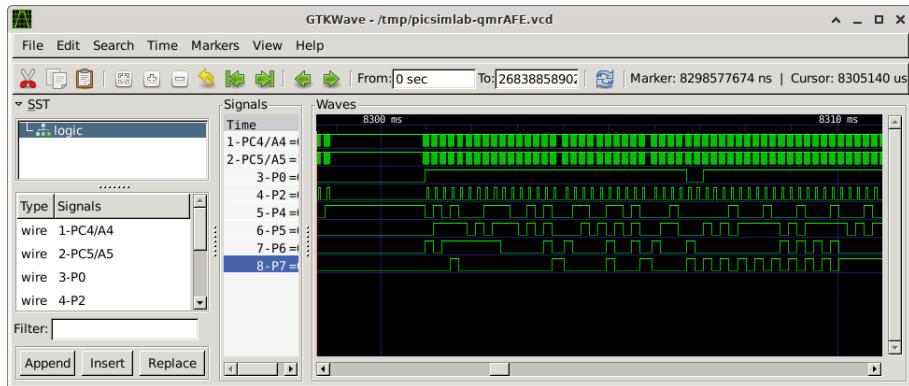

### Examples

#### 10.5.4 VCD Dump

This part is a digital value file dump recorder. The file can be visualized with gtkwave.

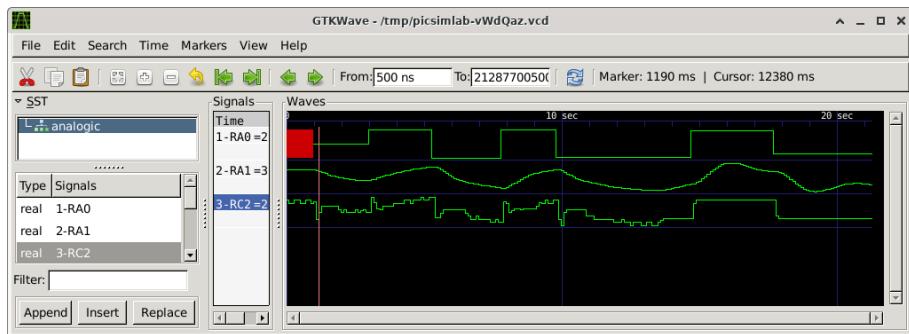

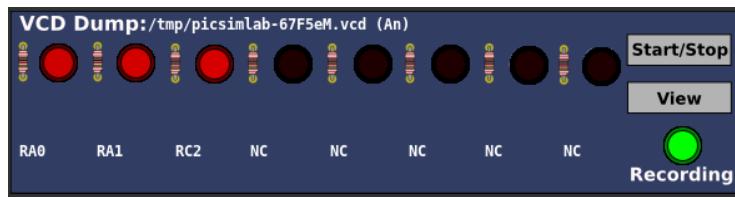

### Examples

#### 10.5.5 VCD Dump (Analogic)

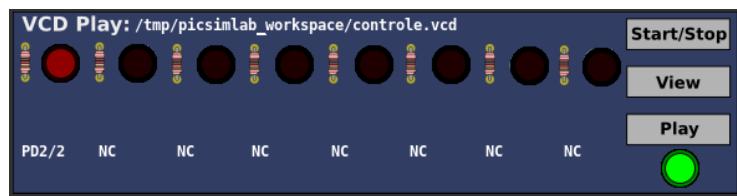

This part is a analog value file dump recorder. The file can be visualized with gtkwave.

### Examples

#### 10.5.6 VCD Play

This part play a VCD file saved from VCD Dump part.

Examples

# Chapter 11

## Troubleshooting

The simulation in PICSimLab consists of 3 parts:

- The microcontroller program
- Microcontroller simulation (made by [picsim](#) and [simavr](#))
- Simulation of boards and parts

When a problem occurs it is important to detect where it is occurring.

One of the most common problems is the error in the microcontroller program. Before creating an issue, test your code on a real circuit (even partially) to make sure the problem is not there.

Errors in the microcontroller simulation can be detected using code debugging. Any instruction execution or peripheral behavior outside the expected should be reported in the project of simulator used ([picsim](#) or [simavr](#)).

If the problem is not in either of the previous two options, the problem is probably in PICSimLab. A good practice is to send a source code together with a PICSimLab workspace (.pzw file) to open the issue about the problem.

# Appendix A

## Use with MPLABX

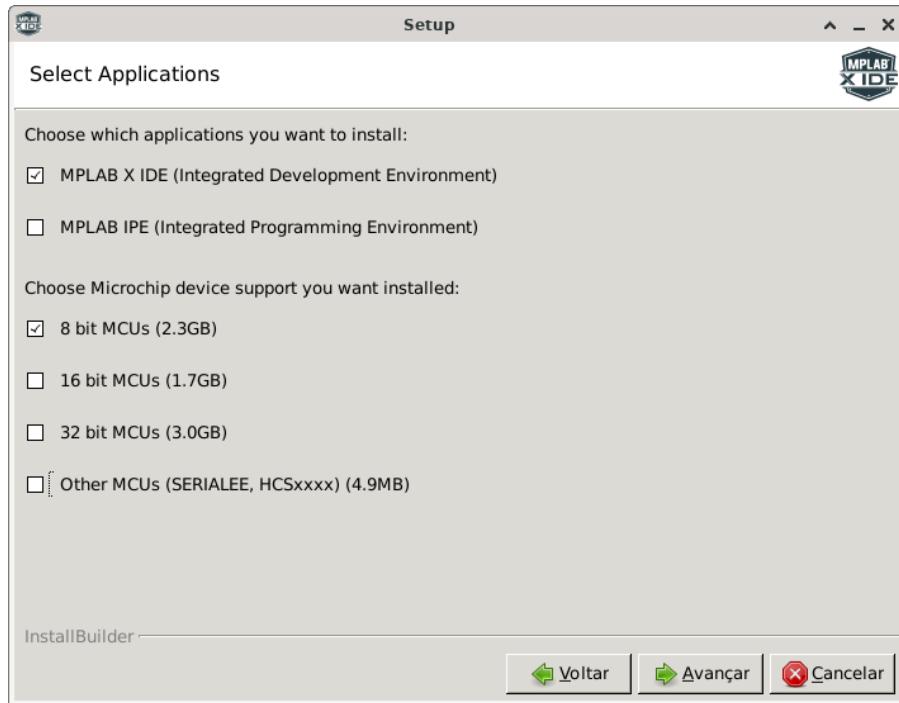

Use with MPLABX to program and Debug

### A.1 Installing the Necessary Tools

#### A.1.1 Install MPLABX IDE and XC8 Compiler

Links for download [MPLABX IDE](#) and [XC8 Compiler](#) installers. Download and install.

For PICSimLab only MPLAB X IDE and 8 bit MCU support needs to be installed.

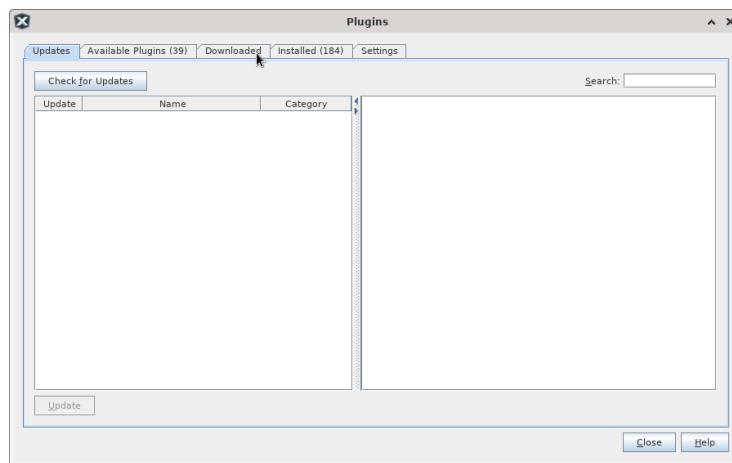

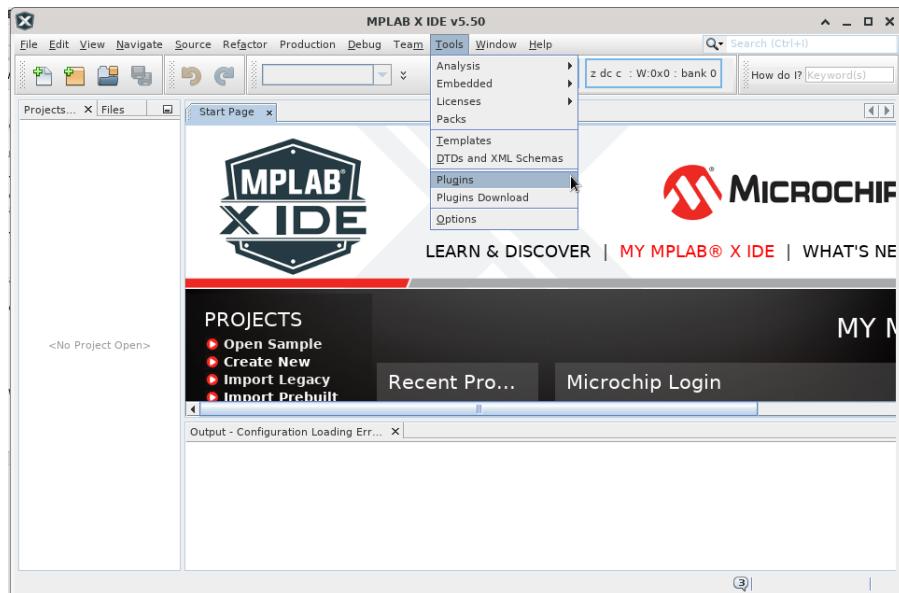

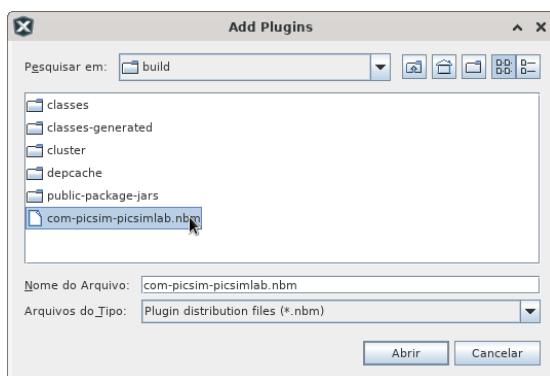

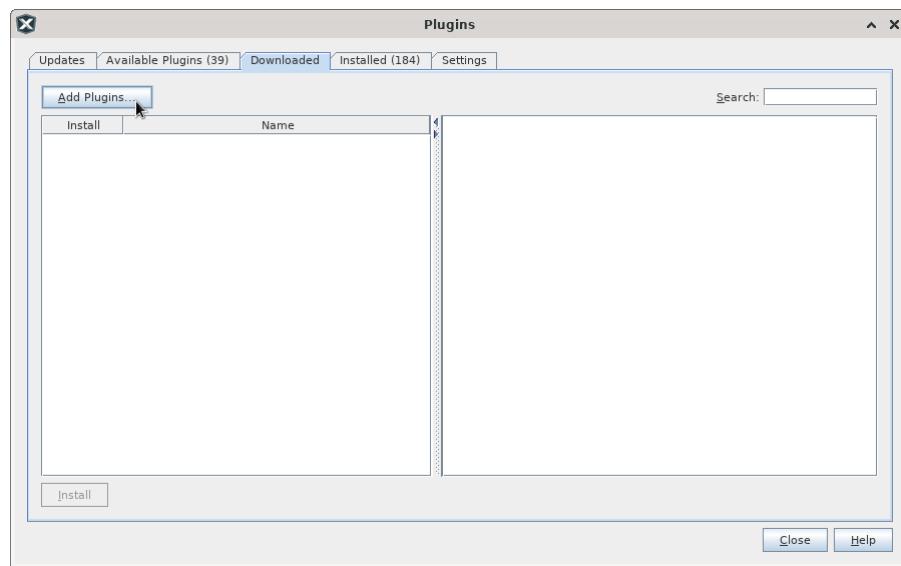

### A.1.2 Install PICsimLab

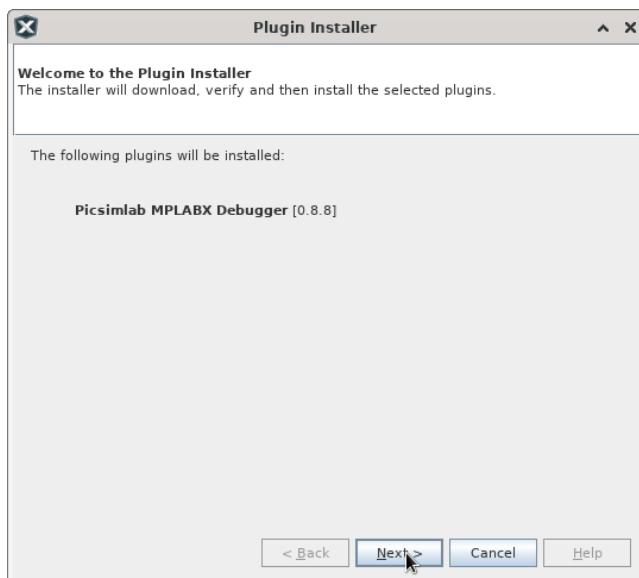

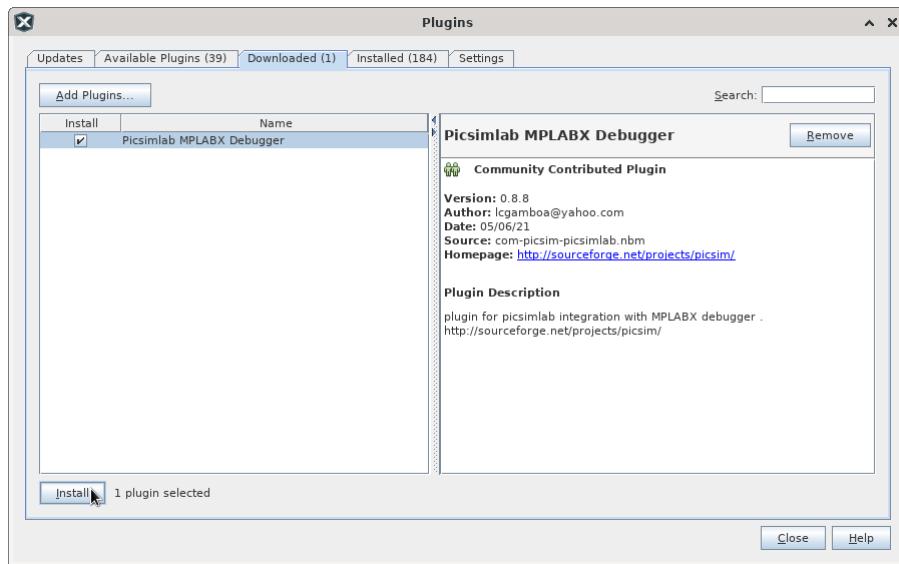

Link for download [PICSimLab](#) installer. Download and install

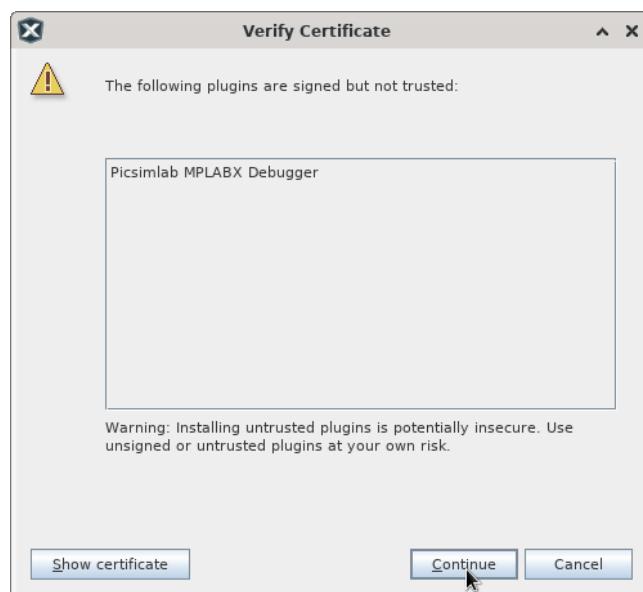

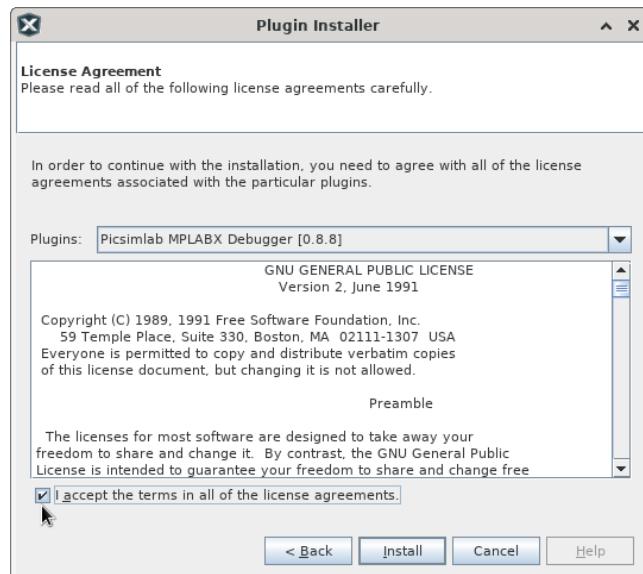

### A.1.3 How to Install PICSimLab MPLABX Debugger plugin

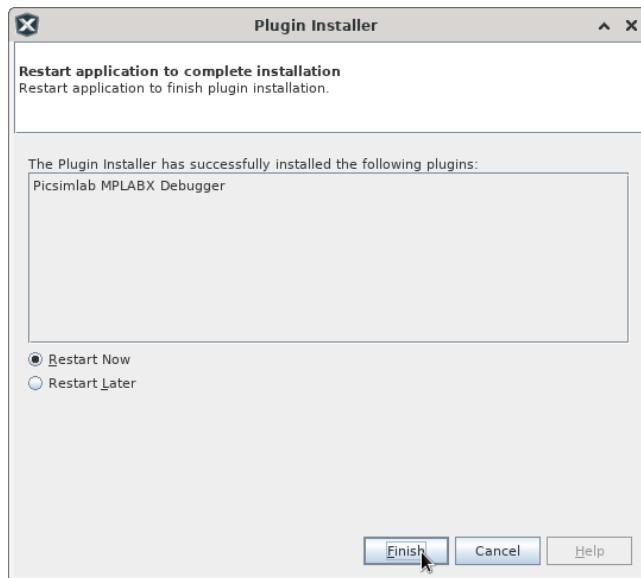

Link for download [PicsimLab MPLABX Debugger plugin \(com-picsim-picsimlab.nbm\)](#)

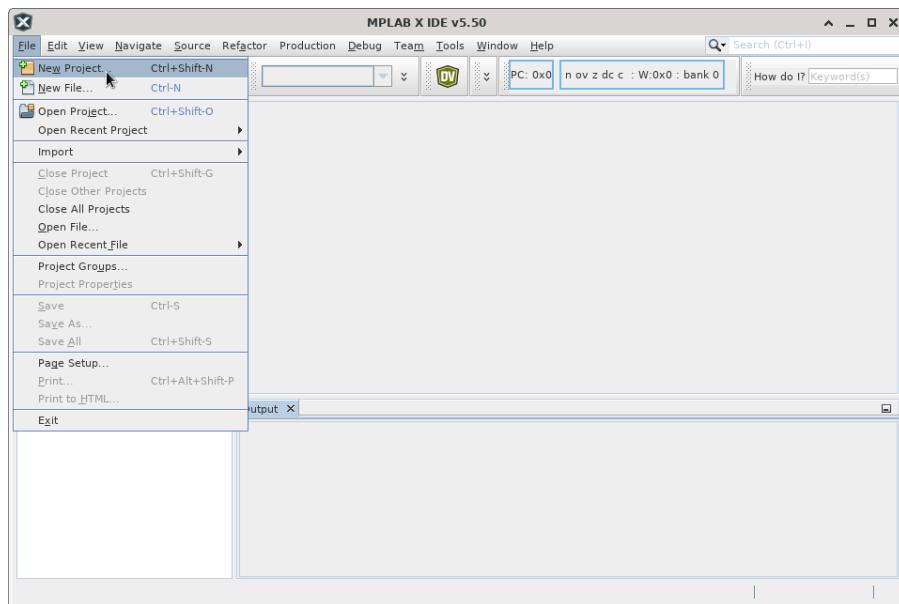

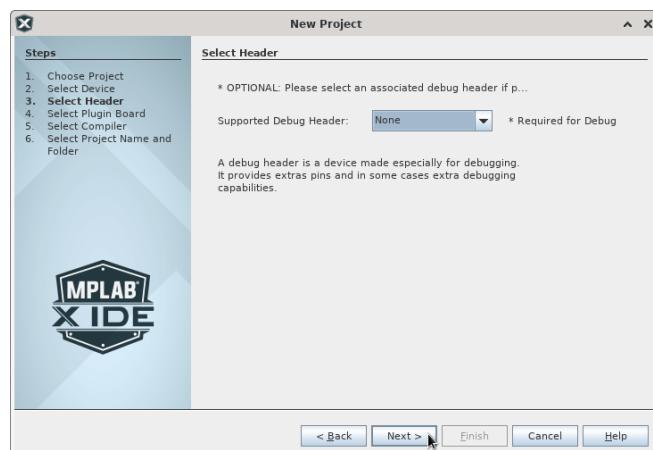

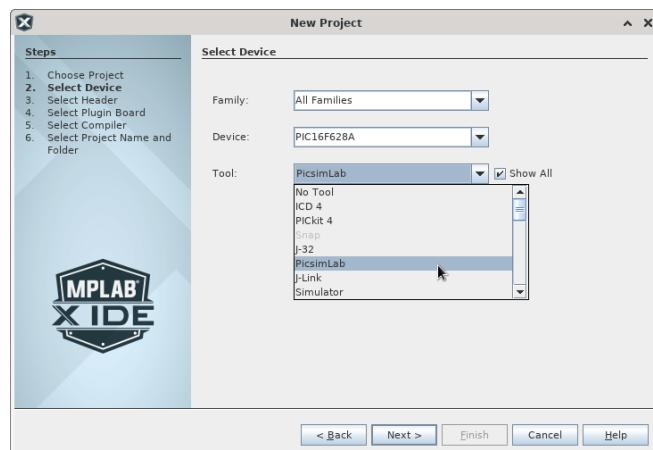

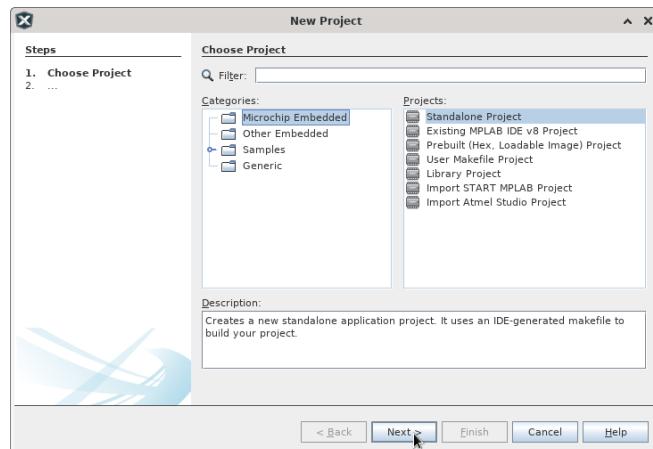

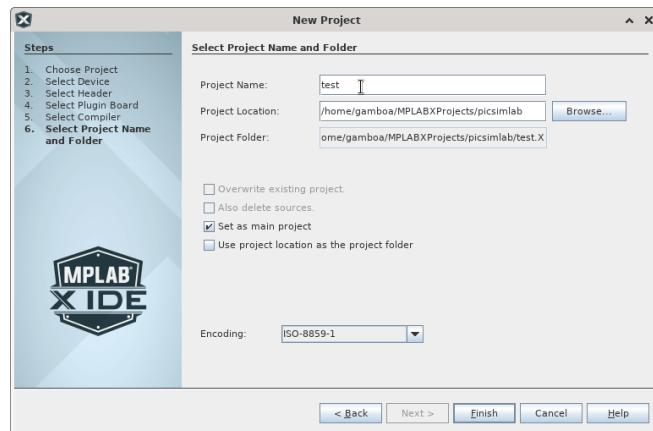

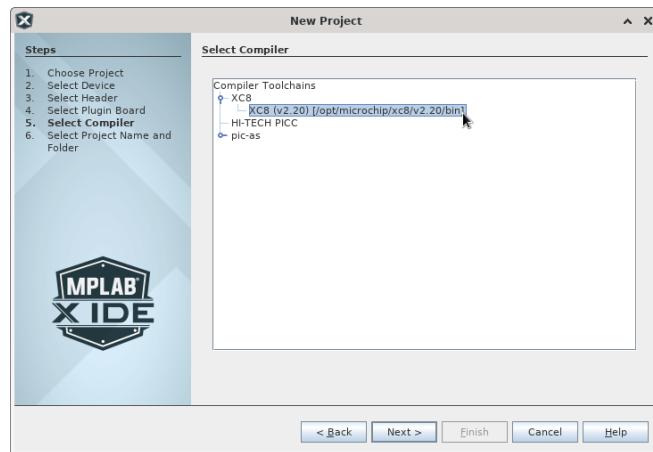

## A.2 Configuring a New Project in MPLABX

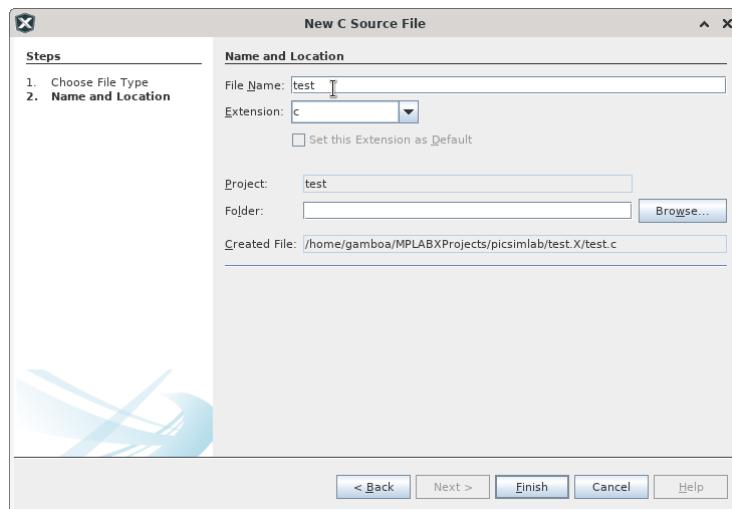

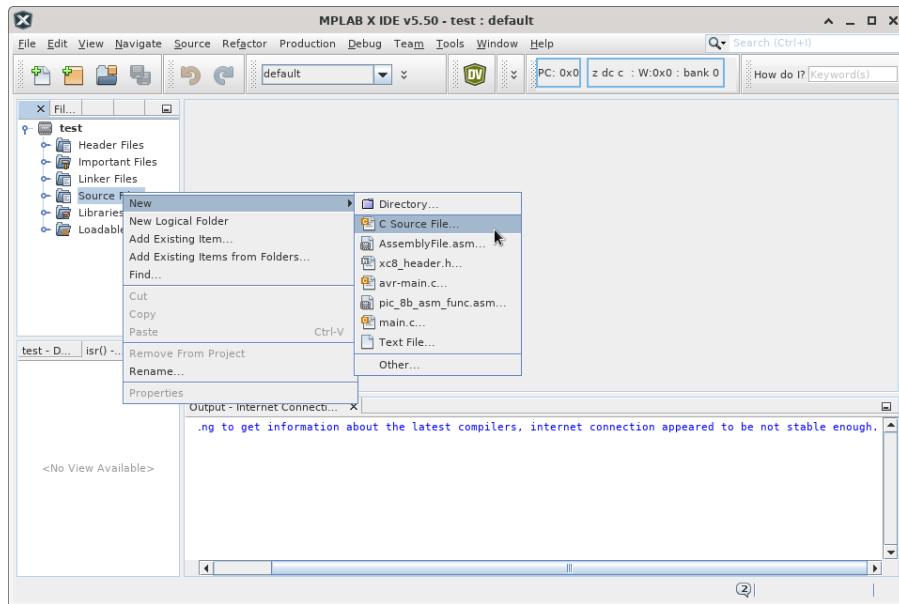

### A.2.1 Project Creation

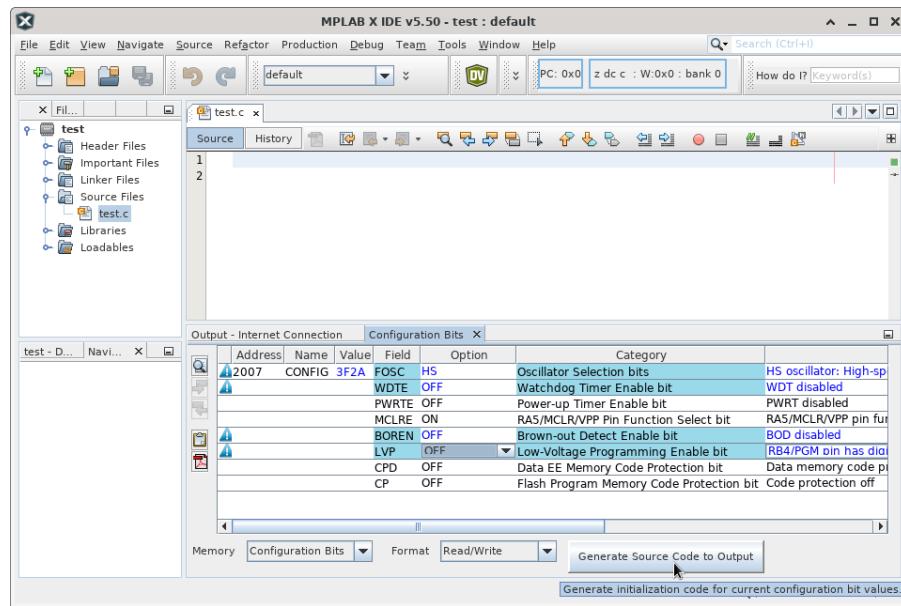

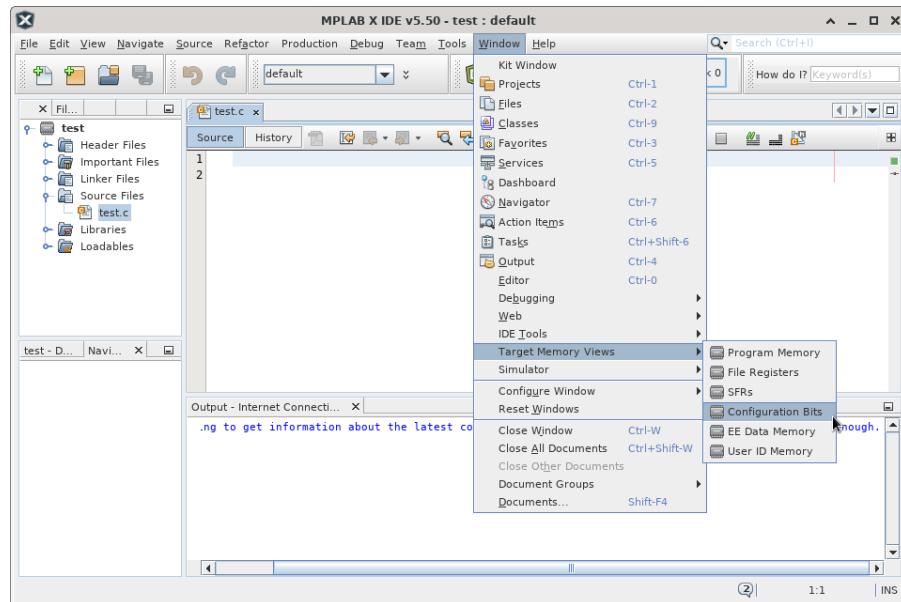

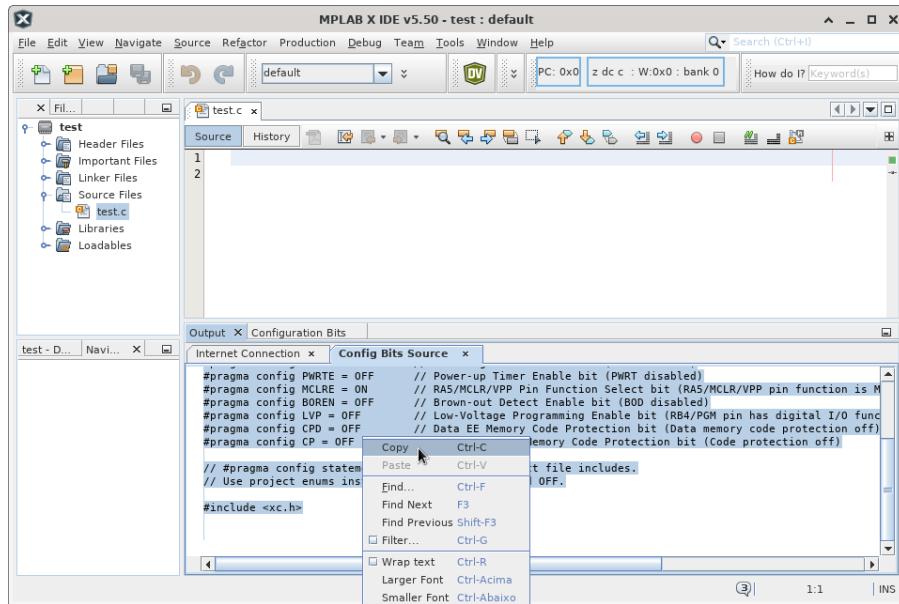

### A.2.2 File Creation

### A.2.3 PIC Configuration Bits

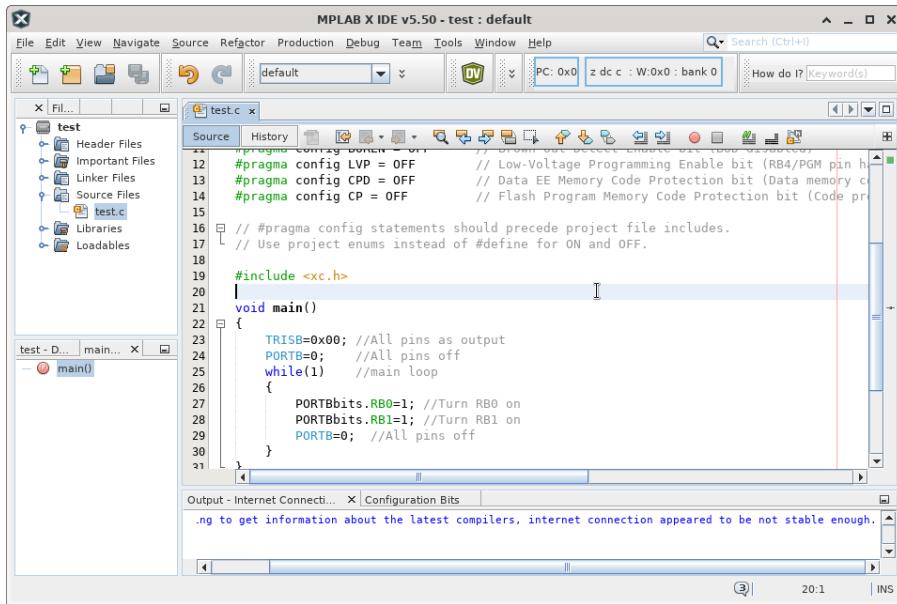

#### A.2.4 Code Example

Paste the configuration and this simple code example in test.c:

```

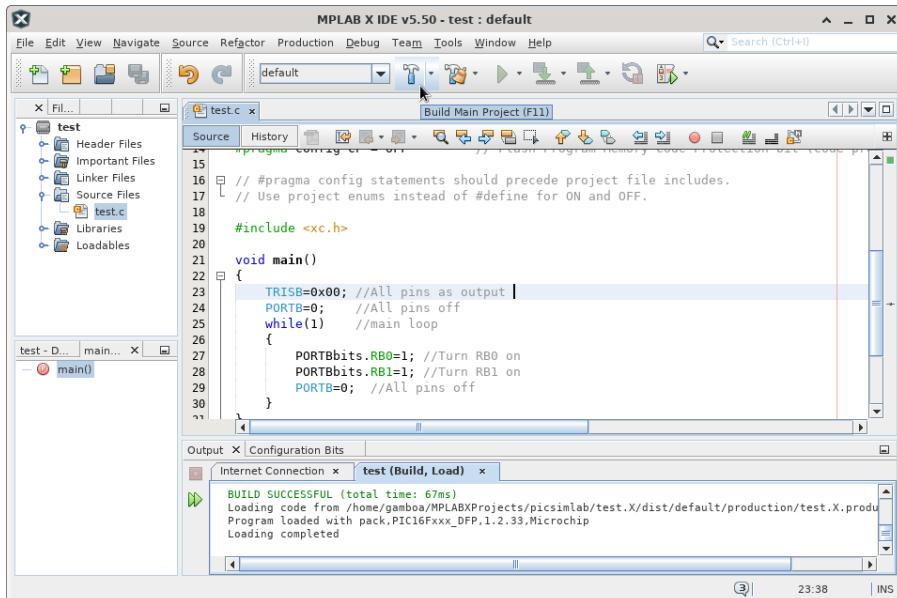

void main()
{
    TRISB=0x00; //All pins as output
    PORTB=0;     //All pins off
    while(1)      //main loop
    {
        PORTBbits.RB0=1; //Turn RB0 on
        PORTBbits.RB1=1; //Turn RB1 on
        PORTB=0; //All pins off
    }
}

```

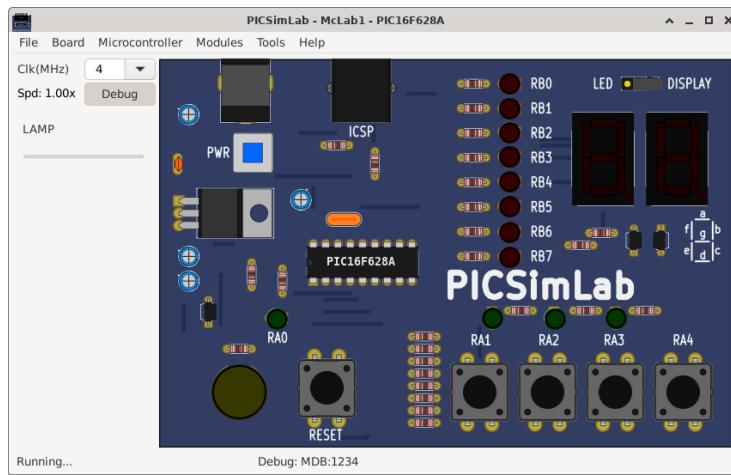

### A.2.5 Building the Project

Use the **Build** button and wait for the message “**BUILD SUCCESSFUL**”.

## A.3 Program and Debug PICsimLab With MPLABX

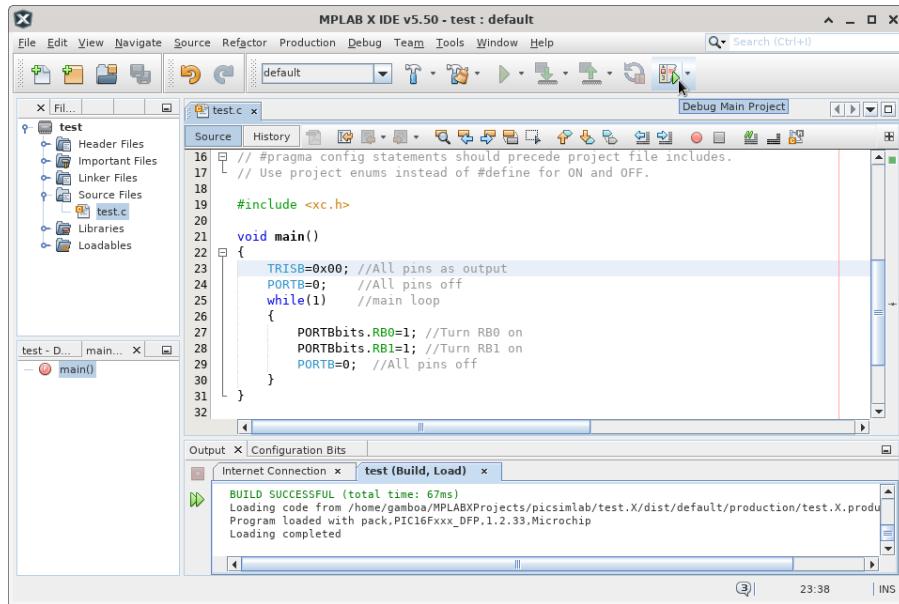

### A.3.1 Starting PICsimLab

The plugin connect to PicSimLab through a TCP socket using port 1234, and you have to allow the access in the firewall. Verify in the PICsimLab statusbar the message "MplabxD: Ok". It's show debugger server state.

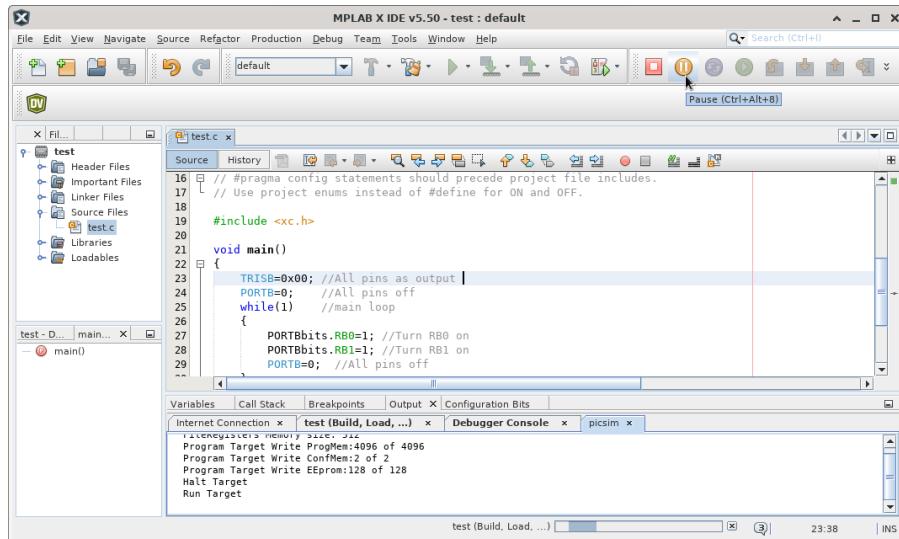

### A.3.2 Programming PICsimLab

Use the **Debug** button to programming PICsimLab.

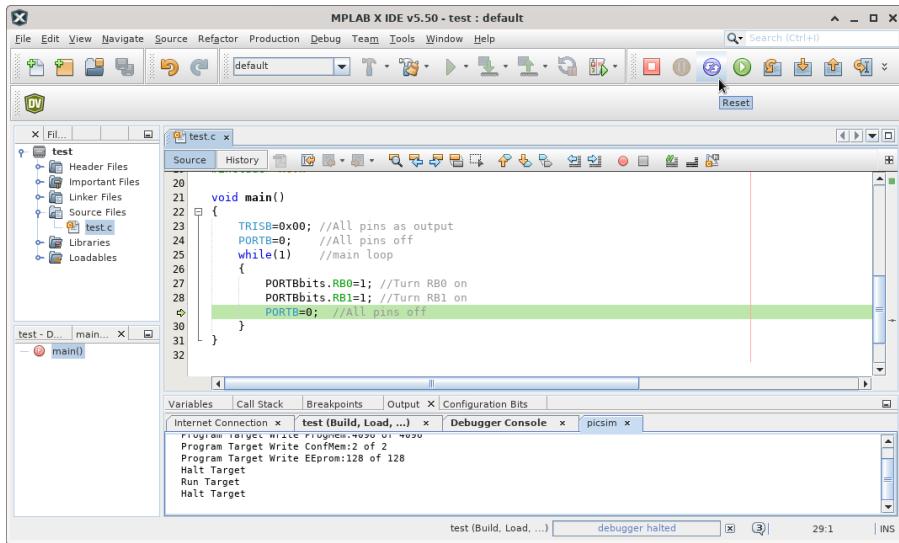

### A.3.3 Pausing the Program

Use the **Pause** button to stop the program and inspect the code and memory.

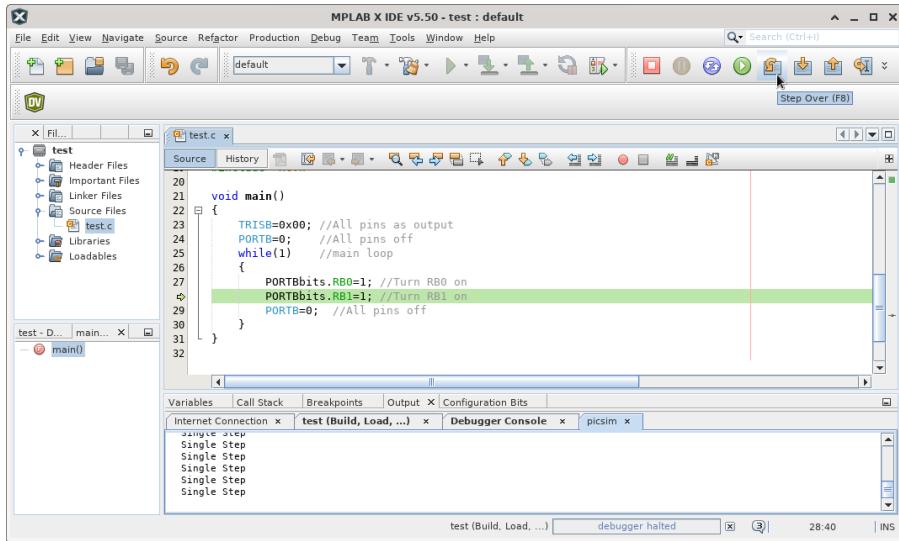

### A.3.4 Restarting the Program

Use the **Restart** button to restart the program.

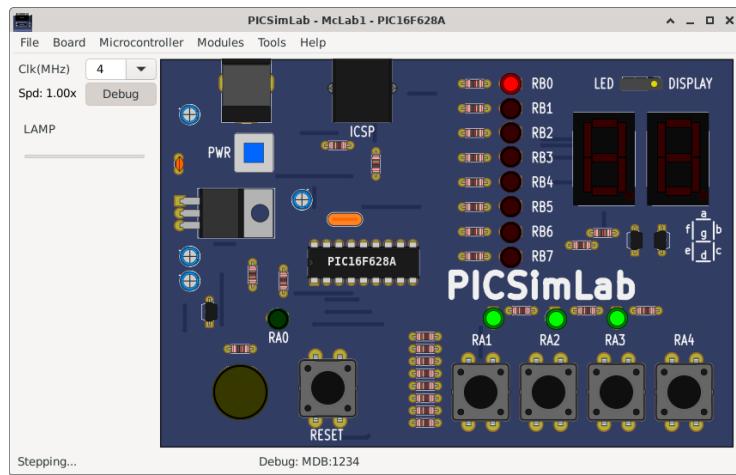

### A.3.5 Running Step by Step

Use the **Step** or **Step Over** button to run the program step by step.

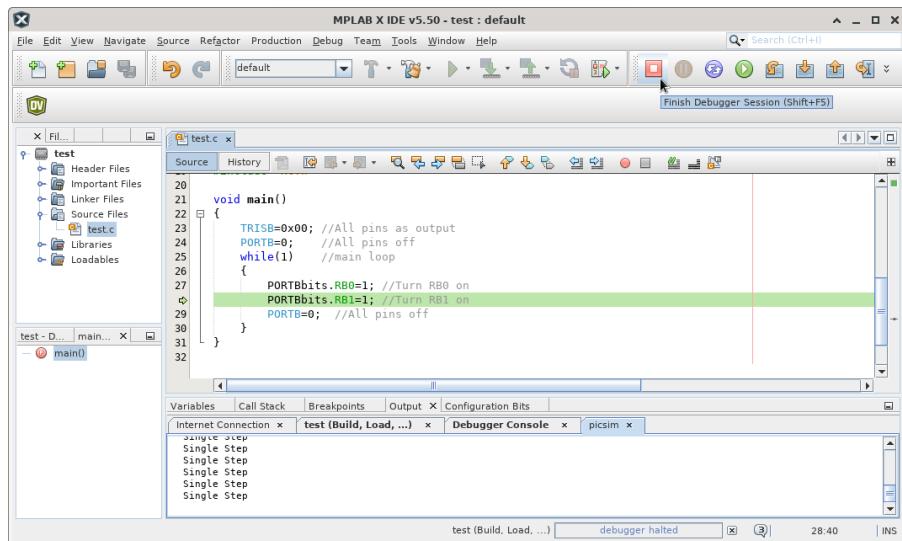

See in the PICsimLab the changes of each step.

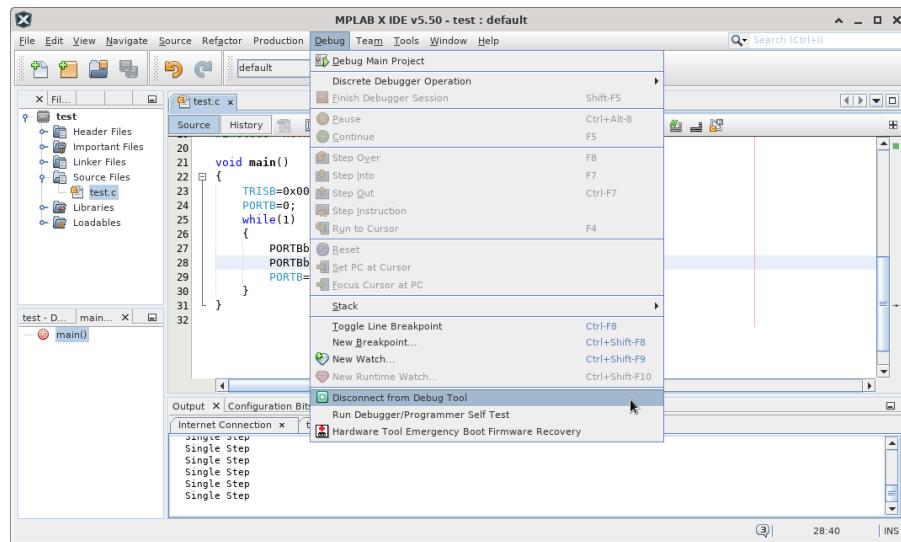

### A.3.6 Stopping Debugger

Use the **Stop** button to turn off the MPLABX debugger.

### A.3.7 Disconnect Debugger

Use the menu **Debug->Disconnect From Debug Tool** to disconnect the MPLABX debugger. The program continues running in PICsimLab after MPLABX debugger is disconnected.

## A.4 This Tutorial in Video

Link for Youtube video version of this tutorial: [How to use MPLABX to program and debug PicsimLab 0.6](#)

## Appendix B

# Creating New Boards

First get the source code and compile as described in [Install from source](#).

### B.1 Creating a New Board

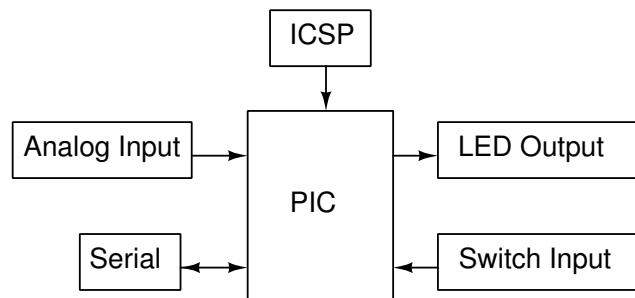

The first step is get the schematic and all information about the board hardware. The second step is the creation of four files in PICSimLab dir (consider replace the 'x' of board\_x for a name of your board in your case):

- Board Picture (share/boards/X/board.svg) or (share/boards/X/board.png);
- Board map (share/boards/X/board.map);
- Board header (src/boards/board\_x.h);
- Board C++ code (src/boards/board\_x.cc);

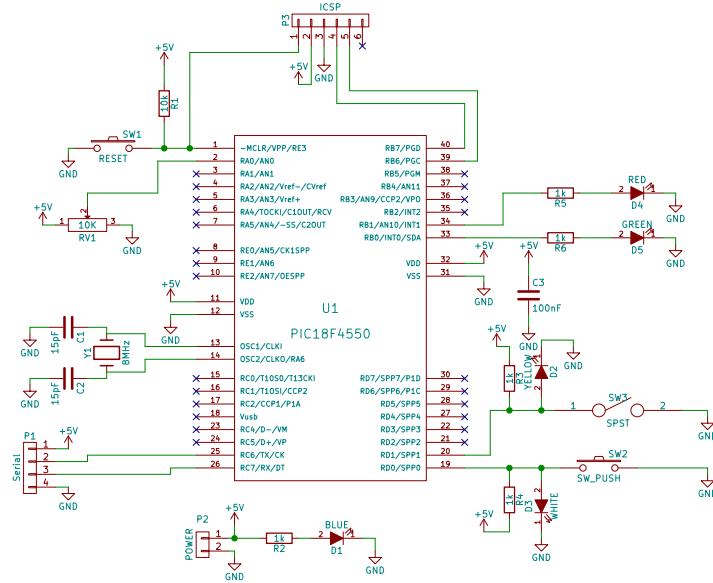

The third and last step is recompiling PICSimLab with new board support.

#### B.1.1 Board Hardware and Schematic

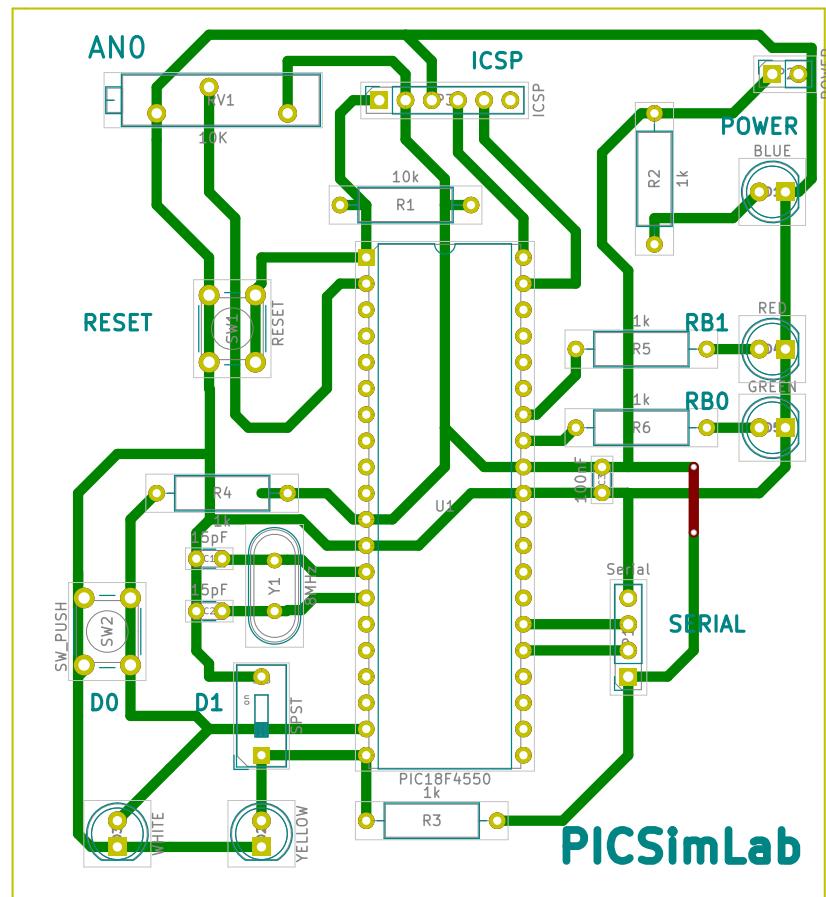

For this tutorial, the board created have the hardware shown in diagram below:

The schematic for the tutorial board made in Kicad.

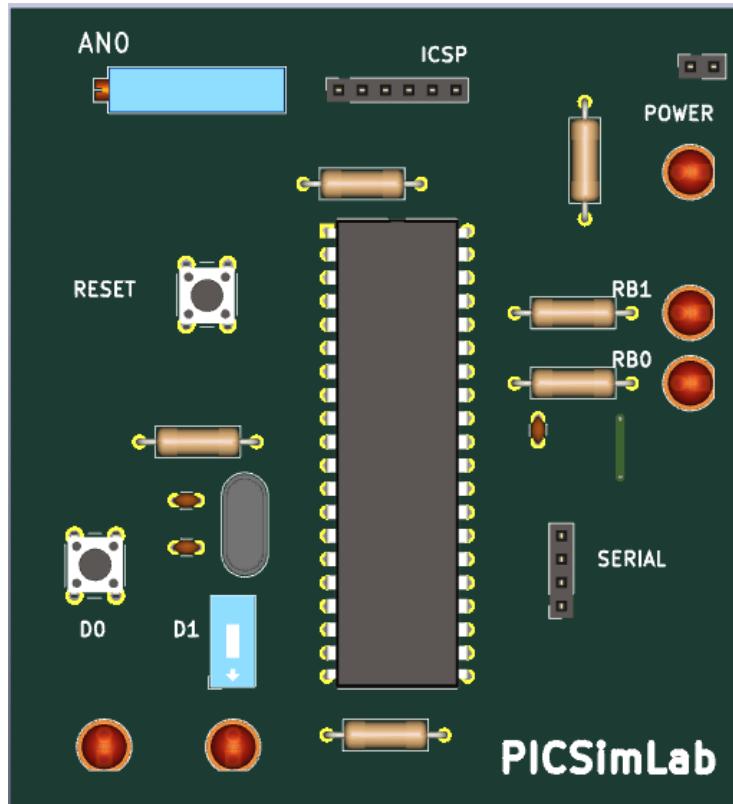

And the PCB layout was made in [Kicad](#) too. The PCB is not necessary if you have a real board.

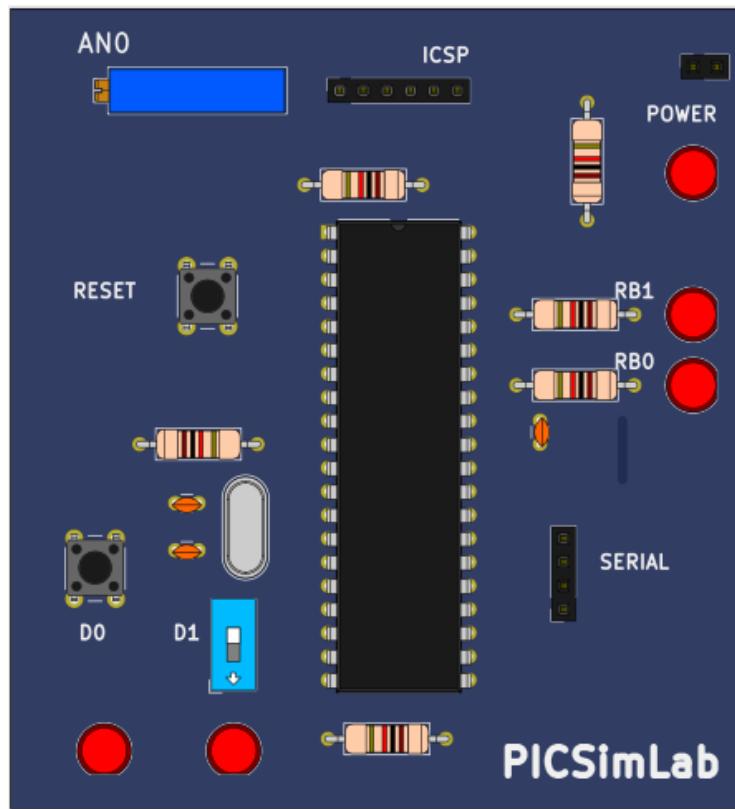

### B.1.2 Board Picture

The PNG board picture was taken from [Kicad](#) 3D viewer. The picture image is saved as “share/board/X/board.png”.

It is also possible to use images in SVG format for better viewing quality. [PCBDraw](#) can be used to convert a Kicad PCB project to an SVG image. The picture image is saved as “share/board/X/board.svg”.

### B.1.3 Picture map

The PICSimLab use one picture image map for inputs and outputs.

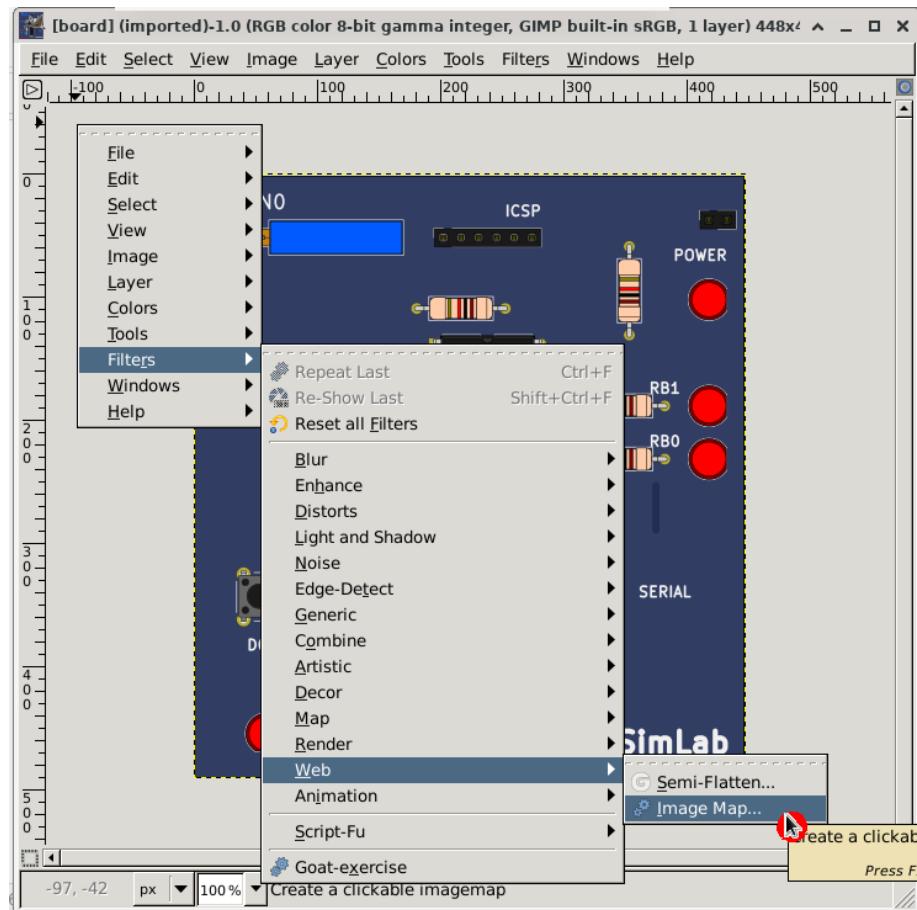

The inputs are the areas in board picture which user can interact (by mouse click) and start with letters “I\_”.

The output are the areas in board picture to be redraw according simulator status and start with letters “O\_”.

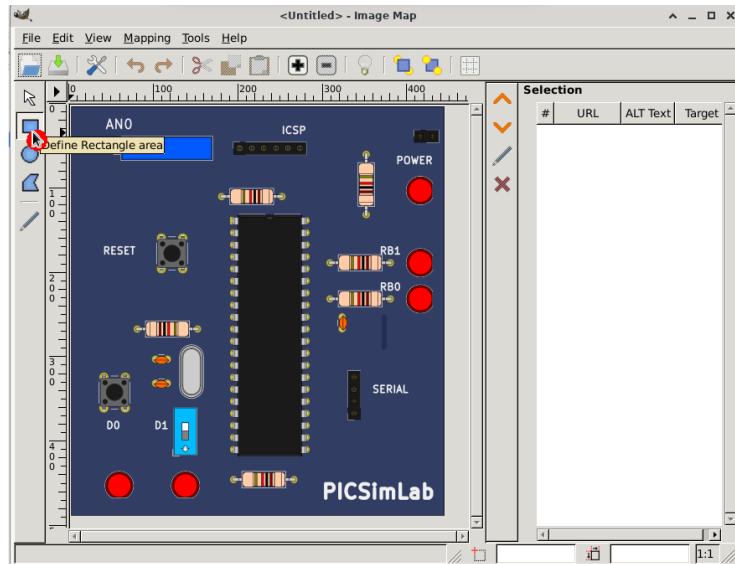

The bidirectional areas in board picture which user can interact and need to be redraw according simulator status are started with letter “B\_”.

The picture map used for PICSimLab are normal HTML image-map. They can be made by hand or using any software which can handle image maps. The original PICSimLab maps are made using [Gimp image editor](#).

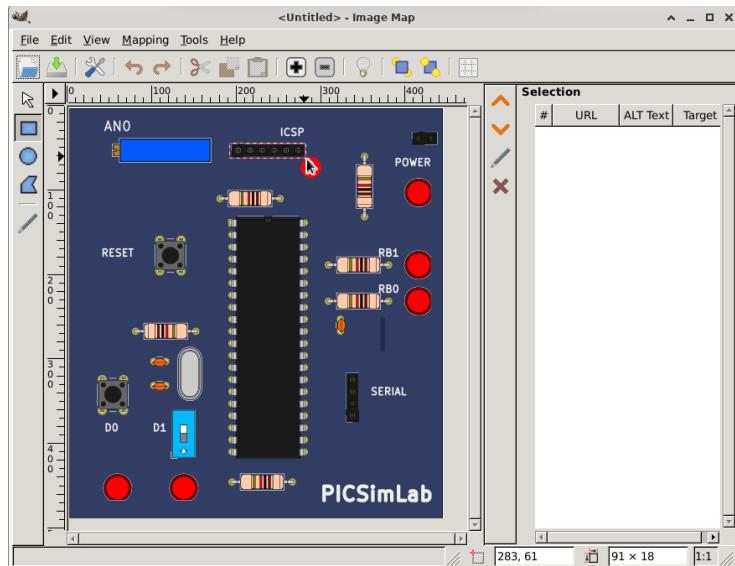

To start, in the GIMP, use the Filters->Web->Image Map to open image map editor window.

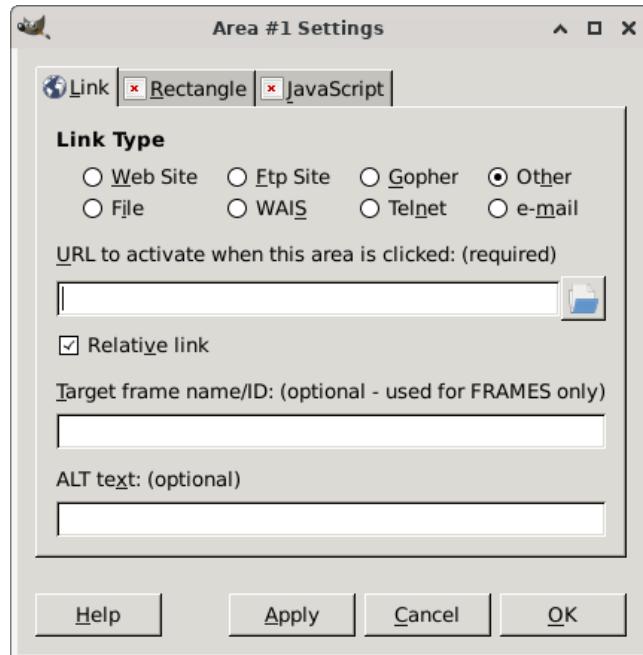

Then select rectangle or circle map on toolbar.

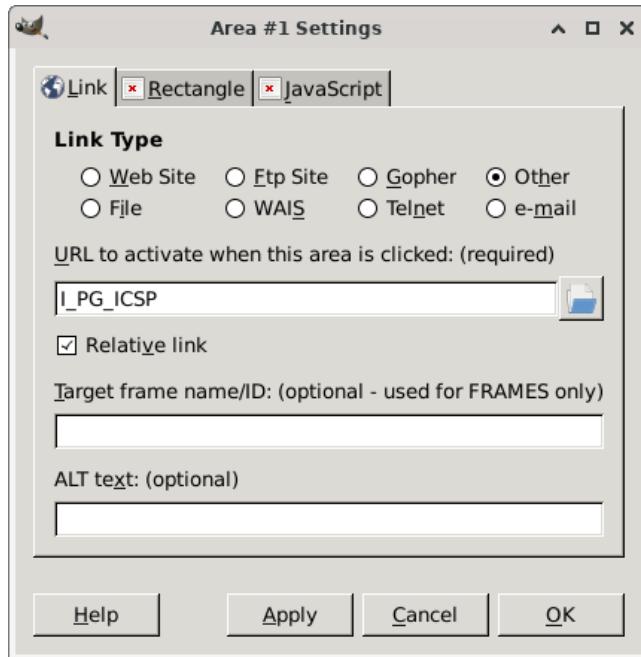

And mark the area in picture.

After area is select, in the settings windows select the link type for “Other”.

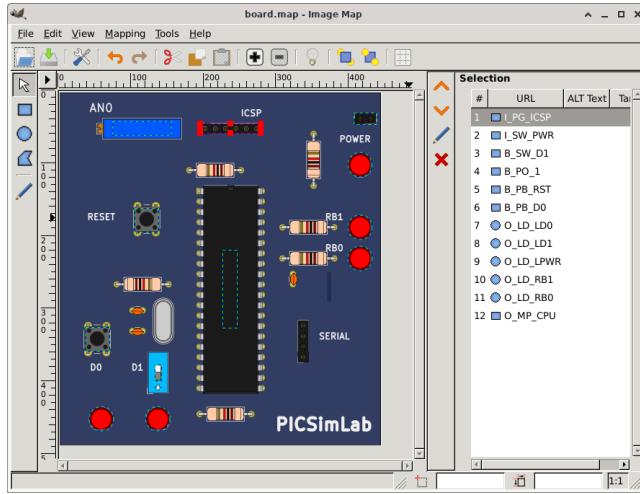

And write the name of area. The name must describe the area function on the board and follow the [Picture Map Reference](#).

### Board map

For this tutorial board, twelve areas are marked:

- I\_PG\_ICSP - where user click to load hexfile.
- I\_SW\_PWR - where user click to turn on/off the board.
- B\_SW\_D1 - Switch connected in RD1.
- B\_PO\_1 - Potentiometer connected to RA0.
- B\_PB\_RST - Button to reset board.
- B\_PB\_D0 - Button connected in RD0.
- O\_LD\_LD0 - draw LED connected in push button D0.
- O\_LD\_LD1 - draw LED connected in switch D1.
- O\_LD\_LPWR - draw power LED indicator.
- O\_LD\_RB1 - draw LED connected in RB1.
- O\_LD\_RB0 - draw LED connected in RB0.
- O\_IC\_CPU - draw microcontroller name.

Board map generated by Gimp image map editor and saved as “share/boards/X/board.map”.

725 //Register the board in PICsimLab
726 board_init(BOARD_x_Name, cboard_x);
```

### B.1.5 Integration with PICsimLab

After include the four files created for new board, the PICSimLab can be recompiled, as described in [Install from source](#).

### B.1.6 Final Result

The PICSimLab board created for this tutorial are shown in the figure below.

The sample program below can be used to test new board, this code is write for XC8 compiler:

```

1 #include <xc.h>;
2
3 #include "config_4550.h"
4 #include "adc.h"
5 #include "serial.h"
6 #include "itoa.h"
7
8 void main()
9 {
10     unsigned int val;
11     char buffer[10];
12
13     ADCON1=0x02;
14     TRISA=0xFF;
15     TRISB=0xFC;
16     TRISC=0xBF;
17     TRISD=0xFF;
18     TRISE=0x0F;
19

```

```
20     adc_init();
21     serial_init();
22
23
24     while(1)
25     {
26         val=adc_amostra(0);
27
28         if(PORTDbits.RD1)
29         {
30             if(val > 340)
31                 PORTBbits.RB0=1;
32             else
33                 PORTBbits.RB0=0;
34
35             if(val > 680)
36                 PORTBbits.RB1=1;
37             else
38                 PORTBbits.RB1=0;
39         }
40         else
41         {
42             if(PORTDbits.RD0)
43             {
44                 PORTBbits.RB0=1;
45                 PORTBbits.RB1=0;
46             }
47             else
48             {
49                 PORTBbits.RB0=0;
50                 PORTBbits.RB1=1;
51             }
52         }
53     }
54
55     serial_tx_str(itoa(val,buffer));
56     serial_tx_str("\r\n");
57 }
58
59 }
```
